## Braking Resistors

### Introduction

When speed of an inverter-controlled ac motor is reduced, the motor acts as a generator, feeding back energy to the frequency converter. As a result, voltage in the intermediate circuit of the inverter increases. When a specific threshold is exceeded, the energy must flow to an external braking system in order to avoid drive failures. Braking resistors are designed to absorb such energy and to dissipate it into heating. The use of brake resistors allows drives to fulfil the requirements of particularly severe duty cycles, for example those featured by frequent braking, long lasting braking or impulsive braking.

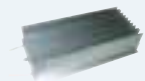

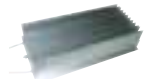

### Bonfiglioli resistors

Bonfiglioli Vectron offers a wide range of safe and compact braking resistors with IP20 degree of protection: "BR series".

BR series are designed for panel mounting.

Mostly, they are equipped with built-in thermal protection.

BR models have been thoroughly tested with Bonfiglioli frequency converters, therefore they can be used together with all Active, Synplus, and VCB models.

\* Rated power is calculated on the basis of intermittent use with a duty cycle of 10%.

## Braking Resistors

Correct selection of a resistor within BR series should take into account the actual braking function of application, both in terms of intensity and of frequency.

Bonfiglioli proposes two different approaches for selection:

1. Below charts show easy drive-resistor combinations granting at least 10% duty cycle (with the exception of some sizes in the VCB range). These combinations usually accomplish the needs of the majority of applications
2. In case of processes requiring "unusual" duty cycles, with heavy or frequent braking, selection should be "tailored" to the application. The Drive Service Center of your Bonfiglioli subsidiary has got qualified staff available to perform a detailed analysis of your application and detect most suitable resistor to meet your requirements.

### Selecting the right size

The charts show recommended matches of Bonfiglioli brake resistors Vs. each drive of the ranges Active, Synplus and VCB. Duty cycles listed in last columns of charts are calculated assuming that resistor is absorbing 100% of drive power.
