# More than safety.

Emil Euchner, the company's founder and inventor of the multiple limit switch, circa 1928.

**Around the world – the Swabian specialists in motion sequence control for mechanical and systems engineering.**

EUCHNER's history began in 1940 with the establishment of an engineering office by Emil Euchner. Since that time, EUCHNER has been involved in the design and development of switch-gear for controlling a wide variety of motion sequences in mechanical and systems engineering. In 1953, Emil Euchner founded EUCHNER + Co., a milestone in the company's history. In 1952, he developed the first multiple limit switch – to this day a symbol of the enterprising spirit of this family-owned company.

## Automation – Safety – ManMachine

Today, our products range from electromechanical and electronic components to complex system solutions. With this wide range of products we can provide the necessary technologies to offer the right solution for special requirements – regardless of whether these relate to reliable and precise positioning or to components and systems for safety engineering in the automation sector.

EUCHNER products are sold through a world-wide sales network of competent partners. With our closeness to the customer and the guarantee of reliable solutions throughout the globe, we enjoy the confidence of customers all over the world.

## Quality, reliability, precision

Quality, reliability and precision are the hallmarks of our corporate philosophy. They represent concepts and values to which we feel totally committed. At EUCHNER, quality means that all our employees take personal responsibility for the company as a whole and, in particular, for their own field of work. This individual commitment to perfection results in products which are ideally tailored to the customers' needs and the requirements of the market. After all: our customers and their needs are the focus of all our efforts. Through efficient and effective use of resources, the promotion of personal initiative and courage in finding unusual solutions to the benefit of our customers, we ensure a high level of customer satisfaction. We familiarize ourselves with their needs, requirements and products and we learn from the experiences of our customers' own customers.

**EUCHNER – More than safety.**

Quality – made by EUCHNER

# Position Switches

**EUCHNER**

## General Information

### Precision single hole fixing limit switches with reed contact or snap-action switching element

EUCHNER precision single hole fixing limit switches are technically sophisticated control switches which have been proving their reliability, day in and day out, for decades in harsh industrial applications.

These mechanically actuated precision single hole fixing limit switches are IP 67 rated and are entirely maintenance-free. EUCHNER precision single hole fixing limit switches feature a thread on the upper part and can thus be inserted or screwed through the mounting hole either from the cable end or from the actuator end. Setting the position of the operating point opposite the part of the machine to be sensed is easy with this thread. The compact overall size and the round type of construction allow installation directly at the sensing points. This feature dispenses with the complicated levers or linkages associated with a high level of design complexity and expense.

### Precision single limit switches

EUCHNER precision single limit switches are technically precise control switches which have been developed on the basis of practical requirements in close collaboration with machine tool manufacturers.

The use of high-quality materials, the interplay of sophisticated technology and practically oriented design guarantee operation under even the toughest conditions.

EUCHNER precision single limit switches are used for positioning and controlling machines and in industrial installations.

The different designs, with a choice of five different types of plunger, and easy adjustability from longitudinal to transverse actuation offer the user a broad range of individual possible applications.

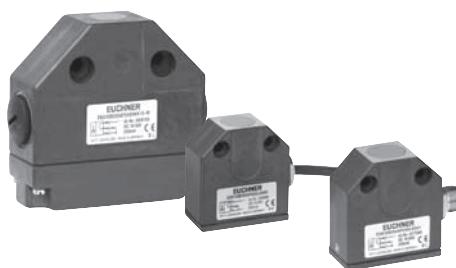

### Inductive single limit switches

Inductive single limit switches are used for positioning and control in all areas of mechanical and systems engineering and systems engineering such as for automation tasks in the wood, textile and plastic industry.

Due to their non-contact and thus wear-free principle of operation, inductive single limit switches are insensitive to heavy vibration, heavy soiling and have an above average mechanical life even in aggressive ambient conditions.

Interchangeability with mechanical single limit switches means that it is possible to straightforwardly modify machines. The switches can therefore be retrofitted on existing machine installations to take full advantage of the benefits of non-contact switches.

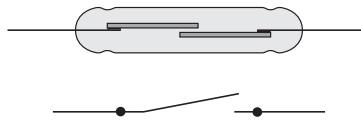

# Position Switches

## Switching Elements with Reed Contact

### Reed contact

The reed contact comprises two ferromagnetic contacts in a glass bulb. When the reed contact is placed in a magnetic field, the contacts adopt opposite polarities and are closed.

For series EGT with reed contact.

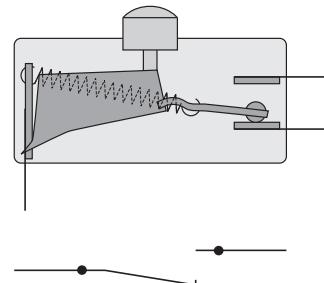

## Mechanical Switching Elements

### Changeover contact with snap-action function

Snap-action switching element<sup>1)</sup> with single gap and three connections.

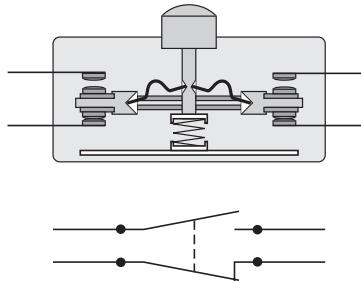

For series EGT with snap-action switch and series N01, NB01, SN01 with soldered connection.

### Snap-action switching element<sup>1)</sup> with one NO contact and one NC contact

With double gap and electrically isolated switching bridge. The two moving contacts are electrically isolated from each other. Switching element with four connections.

For series SN01 with soldered connection and series N1A, N10, N11.

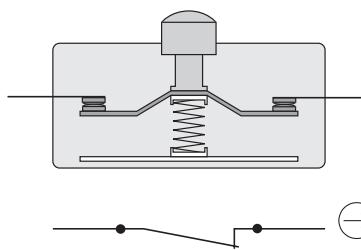

### Safety switching element with slow-action switching contact<sup>2)</sup>

With one positively driven NC contact and double gap. Switching contact with two connections.

For use in single limit switches with safety function.

For series NB01 with safety function and series N1A with safety function.

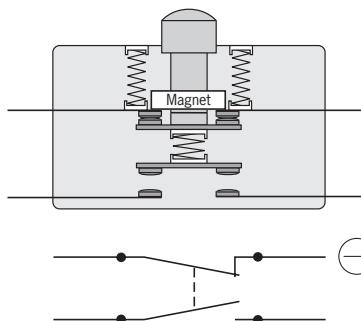

### Safety switching element with snap-action switching contact<sup>1)</sup>

With one positively driven NC contact and one NO contact. Double gap and electrically isolated switching bridge. Switching contact with four connections.

For use in single limit switches with safety function.

For series N1A with safety function.

1) A snap-action switching element has a switching contact which opens or closes regardless of the approach speed during actuation.

2) A slow-action switching element has a switching contact which opens and closes depending on the approach speed during actuation.

# Position Switches

**EUCHNER**

## Positively driven contacts

Positively driven contacts are used in some switching elements. These are special switching contacts that are designed to ensure the switching contacts are always reliably separated. Even if contacts are welded together, the connection is opened by the actuating force.

It is a common feature of all switching elements that at least one switching contact is designed as a positively driven contact. Often two positively driven contacts are employed to increase safety using the principle of duplicated design (redundancy). This dual-channel design ensures that on the failure of one channel or on a fault in the control circuit (e. g. in the machine wiring), the interlocking can still be provided with the aid of the second channel.

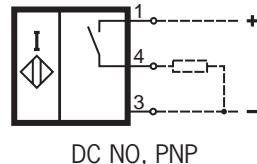

Positively driven position switch.

**Safety switching elements marked with this symbol are not available as replacement switching elements.**

## Inductive Switching Elements

### NO function

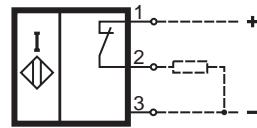

The NO function means that the load current flows when the active face of the inductive switching element is activated and that no current flows when the active face is not activated.

DC NO, PNP

### NC function

The NC function means that the load current does not flow when the active face of the inductive switching element is activated and that current flows when the active face is not activated.

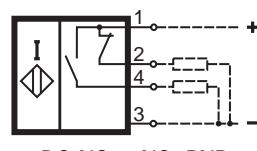

DC NC, PNP

### NO + NC function

The NO + NC function incorporates both an NO function and an NC function.

Associated circuit diagrams and wiring diagrams are given in the technical data.

DC NO + NC, PNP

# Position Switches

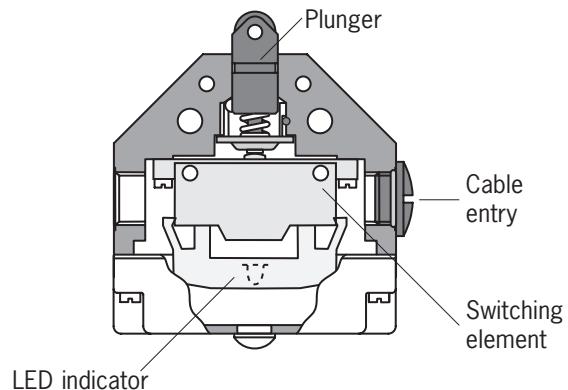

## Precision Single Limit Switches

### Design

The die-cast aluminum housings for the EUCHNER single limit switches have been proven in even the harshest conditions with their high strength and resistance to corrosion.

They do not require a protective paint finish, but can be painted at any time without prior treatment.

Depending on the design, the hardened plungers made of stainless steel run precisely in either the anodic oxidized guide bore in the housing or in a sintered bronze sleeve. These maintenance-free sliding elements make a key contribution to the reliability and correct operation of the switches. Even beyond the guaranteed mechanical life.

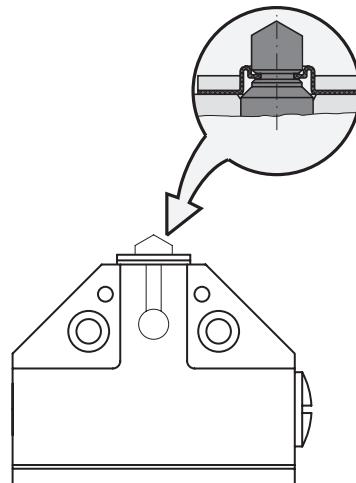

### Exterior diaphragm

To provide protection against resinous cooling lubricants and against the penetration of very small particles, e. g. saw dust, graphite and glass dust, a series with an exterior diaphragm is available.

The exterior diaphragm provides additional sealing of the plunger outside the housing.

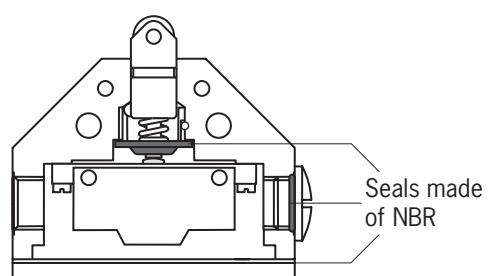

The plunger guides in the housing are thus reliably protected from the penetration of the cooling lubricant. Plunger sticking is prevented and the replacement of the switch or plunger is unnecessary. For technical data on this series see page 31.

### Seals

EUCHNER uses the high-quality and proven acrylonitrile-butadiene rubber (NBR) for all seals and sealed areas. This material is resistant to oils, greases, fuels, hydraulic fluids and most known cooling lubricants. Moreover, NBR possesses high mechanical rigidity over a wide temperature range and so it is perfectly suitable for the highly stressed diaphragm seal, which separates the plunger compartment and the interior of the switch.

The material of the diaphragm seal is a key criterion for the quality, mechanical life and precision of the EUCHNER precision single limit switches. The same material is used for the cover seal and the cable entry.

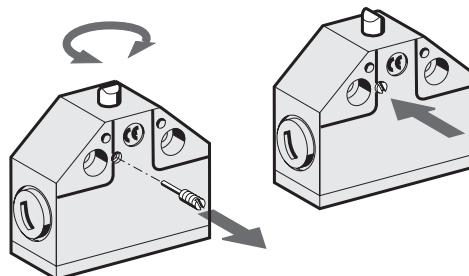

# Position Switches

**EUCHNER**

## Adjustability

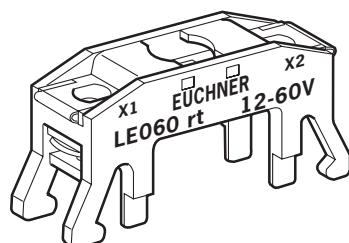

On the chisel plungers and the roller plungers (normal and extended) the approach direction can be changed by 90° at any time. After unscrewing the locking pin, the plunger can be rotated by 90°.

## LED function display

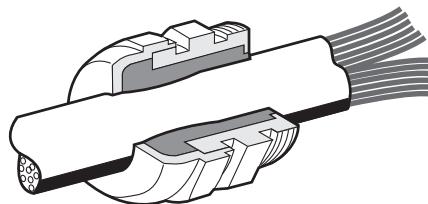

If required, the EUCHNER single limit switches of design N1A can be equipped with an LED function display (AC/DC 10 - 60 V or AC 110/230 V, color red).

Built-in electronic regulation ensures that the luminosity remains constant independent of the voltage applied.

## Cable connection

EUCHNER position switches are tested to degree of protection IP 67 in accordance with IEC 60529. In order to obtain this degree of protection, only high-quality metal cable glands with a captive sealing ring are used. A selection for different cable diameters is listed on page 44.

# Position Switches

**EUCHNER**

## Single Hole Fixing Limit Switches - Cylindrical Design

The round design with simple, single-hole assembly allows installation of the controls directly at the scanning points. Exact adjustment is permitted by means of the precision metric thread. The limit switches with inert gas contact (reed contact) can be operated up to a water column pressure of 30 meters with degree of protection IP 68.

### Features

- ▶ 6 basic types M12 x 1 to M18 x 1.5
- ▶ Housing of nickel-plated brass or stainless steel
- ▶ Mechanical life up to 30 million operating cycles
- ▶ Degree of protection IP 68 / IP 67
- ▶ Switching point accuracy  $\pm 0.01$  max.
- ▶ With hard-wired cable or with M 12 plug connection

# Position Switches

## Precision single hole fixing limit switches

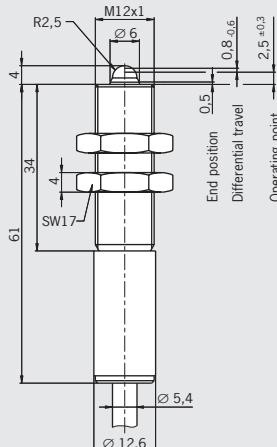

- With reed contact and protective diode
- Plunger material stainless steel
- Any installation position

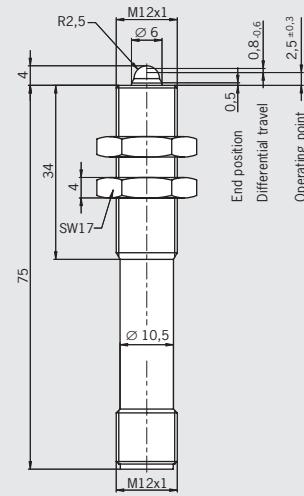

**Design EGT12, M12 x 1, dome plunger**  
Connection cable, double insulated

### Dimension drawings

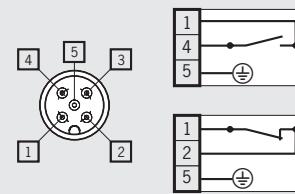

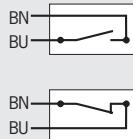

**Design EGT12, M12 x 1, dome plunger**  
Plug connector M12 with PE connection

**⚠ Never switch incandescent lamps. Not even for test purposes.**

Single hole fixing limit switches must not be used as an end stop.

## Multiple clamping strip

- ▶ For single hole limit switch with threaded section M12 x 1
- ▶ Switch position as for multiple limit switches in accordance with DIN 43697
- ▶ For 2, 4 or 6 single hole fixing limit switches

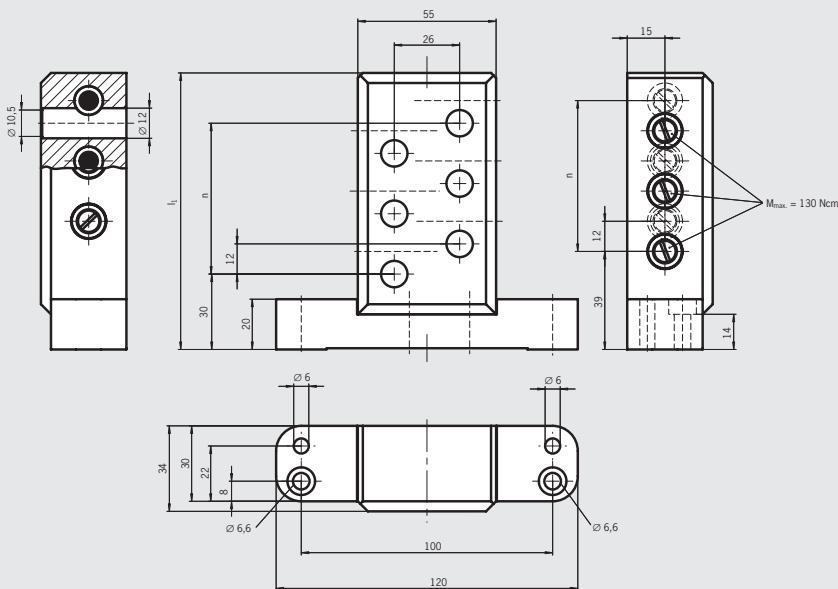

The multiple clamping strip is used for mounting several single hole fixing limit switches of design EGT 12 / EGM 12.

The robust actuator-sensor bracket with quick-action fastening system is mounted on an aluminum flange with fastening holes in accordance with DIN 43697.

## Precision Single Limit Switches

These switches are used in mechanical and systems engineering for controlling and positioning tasks. The robust housings made of die-cast anodized aluminum are characterized by their high level of mechanical endurance and corrosion resistance.

### Features

- ▶ 9 basic types in die-cast aluminum casing
- ▶ From the miniature version 40 x 40 mm to the standard size according to DIN 43693
- ▶ Mechanical life up to 30 million operating cycles
- ▶ Designs with safety function for mechanical and personal protection
- ▶ 4 different plunger types
- ▶ Cable entry or M12 plug connection

Design N1A  
M12 plug adjustable, 4-pin + PE

### Dimension drawings

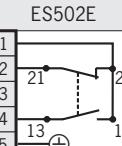

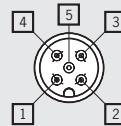

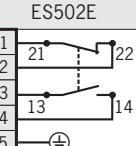

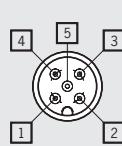

### Design N1A

M12 plug adjustable, 4-pin + PE

### Wiring diagrams

**⚠** To achieve the positively driven travel, the dimension 31.05 must be maintained by the trip dog. Actuating elements such as dog approach guides must be firmly mounted in accordance with EN 1088, i.e. riveted, welded or otherwise secured against becoming loose.

## Inductive Single Limit Switches

Inductive single limit switches are non-contact in operation. They are used as an alternative to mechanical switches. The main advantage is their wear-free operating mode. They are noted for their insensitivity to corrosive ambient conditions and their virtually unlimited mechanical life.

### Features

- ▶ High actuating velocity and high operating frequency
- ▶ Resistant to strong vibrations and coarse soiling
- ▶ Resistant to most cutting oils and coolants
- ▶ Replacement for precision single limit switch of the same design

# Position Switches

## Additional products

### Trip rails/trip dogs

#### U-trip rails

enable the trip dogs to be adjusted from the switch side. The trips dogs can be installed and adjusted quickly and easily in any location.

#### U-trip dogs

are designed for usage in U-trip rails. They have an expansion plate clamp and enable precise adjustment, even when the limit switch is activated.

#### G-trip rails

enable the trip dogs to be adjusted from the side opposite the switch. They are made of steel and are protected from corrosion by a special surface treatment. Trip rails can be ordered pre-assembled or as a component for self-assembly.

#### G-trip dogs

are designed for use in G-trip rails. The trip dogs are clamped in the trip rail by a hexagon socket head screw with spring washer. This washer locks the trip dog in place even when the trip rail is in a vertical position and allows precise adjustment.

For detailed information see catalog for multiple limit switches.

## Appendix

### Terms and explanations

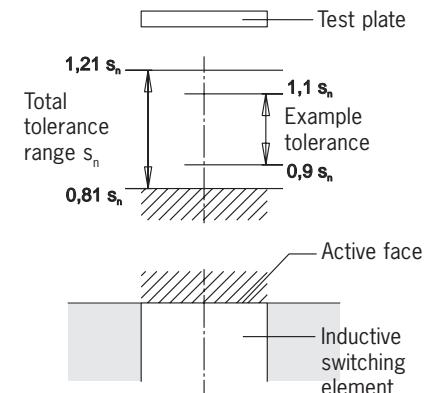

#### Rated operating distance $s_n$

The rated operating distance is a general variable used for measurement of operating distances. It does not take into account either the production tolerances or changes caused by external effects such as voltage and temperature.

#### Assured operating distance $s_a$

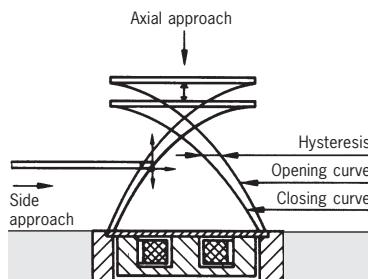

The assured operating distance is the operating distance at which correct operation of the inductive switching element is guaranteed within the permissible operating conditions (temperature and voltage).

The actuation distance lies between 0 and 81 % of the rated operating distance  $s_n$ .

#### Hysteresis H

The hysteresis is the difference in distance terms between the ON point as the test plate approaches and the OFF point as it moves away from the active face of the inductive switching element.

#### Repeat accuracy R

The repeat accuracy is the accuracy of the real operating distance  $s_r$  for two switching actions in succession within 8 hours at an operating temperature of  $23 \pm 5^\circ\text{C}$  and an operating voltage of  $UB \pm 5\%$ .

#### Operating voltage $U_B$

The operating voltage defines the voltage range in which the inductive switching element functions reliably. The specified values represent limits without any tolerances. The values can be obtained by referring to the technical data for the switching element. In the case of two-wire switching elements, this is applicable only in series connection with the load.

#### Voltage drop $U_d$

The voltage drop is measured across the active output of the inductive switching element when the output is in the "active energized" condition and when the rated operating current  $I_e$  flows.

#### Rated operating current $I_e$

The rated operating current is the nominal current which can load the inductive switching element in continuous operation.

#### Off-state current $I_r$

The off-state current is the current which flows in the load circuit of an inductive switching element in the non-conducting condition. In practical terms, this current has to be taken into account only for two-wire switching elements.

#### Minimum operating current $I_m$

The minimum operating current is the minimum current required for the function of a 2-wire switching element in active energized condition.

#### Inrush current $I_k$

The inrush current is the maximum current which can flow in an AC-2-wire switching element for a particular period at the moment it is switched on. The details in the technical data are valid for 20 ms.

#### Switching frequency f

The switching frequency is the maximum possible number of switching operations per second. This is determined according to IEC 60947-5-2 and is based on a mark-space ratio of 1:2. The switching frequency is a switch-specific variable and can be obtained by referring to the technical data for the switching element.

#### Ambient temperature T

The ambient temperature is the temperature range in which the reliable operation of the inductive switching element is guaranteed. This range is between  $-25$  and  $+70^\circ\text{C}$ .

#### Temperature drift $\Delta s$

The temperature drift defines the offset in the switching point in  $\mu\text{m}/\text{K}$  on a change in the ambient temperature from  $-25$  to  $+70^\circ\text{C}$  under otherwise constant measurement conditions.

# Position Switches

## Suppressor circuits

The inductive switching elements are largely protected against external interference by use of various circuit techniques (suppressor circuits).

For utilization category DC-13 the output is to be protected with a free-wheeling diode for inductive loads.

### Short-circuit and overload protection

The inductive switching elements are designed so that short circuits cannot damage the outputs. **Pulsed short circuit protection** is used.

This means that the output transistor is switched off and on again in quick succession in the event of overloading or a short-circuit. In this way, it is possible to establish whether the fault is still present or has been rectified.

### Transient protection

EUCHNER proximity switches are protected against interference caused by the occurrence of inductive voltage peaks in accordance with IEC 801-4.

The respective values are specified in the technical data. Testing is performed in accordance with the stipulations in DIN VDE 0660, Part 208 and IEC 947-5-2.

### Wire break safety

The EUCHNER proximity switches with wire break safety are designed such that on a wire break on any connection, the switch does not output a spurious signal.

### Reverse polarity protection

Protection against reverse polarization of the operating voltage.

## Customized versions

### Inductive switching elements according to NAMUR

These switching elements fulfill the specification IEC 60 947-5-6 and IEC 61 934.

The current consumption at  $U_B = 8.2$  V is greater than 2.5 mA when the oscillator face is not activated and less than 1.0 mA when the oscillator face is activated.

The current consumption characteristic is linear during the transition from the inactivated to the activated state of the oscillator face, i.e. these switches do not have a snap action.

### DC-2-wire switching elements

Two-wire switching elements can be used in principle instead of mechanical switches. Their low off-state current makes them especially suitable for use in conjunction with programmable logic controllers. Compared with three-wire switching elements they have the advantage of requiring less wiring.

### Increased operating distance

For designs with 12 mm proximity switch spacing, switching elements with increased operating distance are available on request ( $s_n = 5$  mm).

Due to their technical characteristics, these switching elements can be used both with a pulsed operating voltage and an operating voltage that is not pulsed.

# Product Guide

## Automation

### Position Switches

- ▶ Position Switches
- ▶ Position Switches according to EN 50 041

### Precision Multiple Limit Switches

### Inductive Limit Switches

### Plug Connectors

### Trip Rails/Trip Dogs

### Inductive Ident Systems

## Safety

### Safety Switches, Metal Housing

- ▶ Safety Switches NZ/TZ
- ▶ Safety Switches NX/TX

### Safety Switches, Plastic Housing

- ▶ Safety Switches NM
- ▶ Safety Switches NP/GP/TP
- ▶ Safety Switches STM
- ▶ Safety Switches STP

### Non-Contact Safety Switches

- ▶ Non-Contact Safety Switches CES/CEM,  
Transponder Coding
- ▶ Non-Contact Safety Switches CMS,  
Magnetic Coding

### Safety Products with integrated Bus Interface

### Bolts for Safety Guards

### Enabling Switches

### Safety Relays

- ▶ Safety Relays ESM
- ▶ Modular Safety System ESM-F

### Rope Pull Switches

## ManMachine

### Joystick Switches

### Electronic Handwheels

### Pendant Stations

- ▶ Pendant Stations HBA
- ▶ Pendant Stations HBE/HBL

### Electronic-Key-System

The image is a vertical collage of four distinct photographs related to industrial automation and safety. From top to bottom: 1) A close-up of a blue robotic arm or gripper mechanism. 2) A red safety fence or barrier in an industrial setting. 3) A yellow conveyor belt system with various components like rollers and sensors. 4) The interior of a factory or industrial plant, showing pipes, structures, and equipment.
