## High Speed High Accuracy Eddy Current Type Digital Displacement Sensor GP-X SERIES

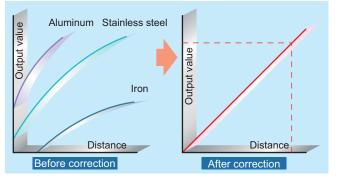

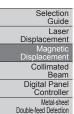

# High-speed sampling and high resolution. The new choice for even more variegated data collection and processing.

### They perform with a ±0.3 % F.S. linearity for stainless steel and iron

Because they perform with a  $\pm 0.3 \%$  F.S. linearity, they can be used for sensing stainless steel and iron enabling precise measurements not affected by the work's material. Specifications corresponding to each material (stainless steel, iron, aluminum) has already been inputted in the controller enabling the easy selection of the setting that is most suitable for the particular material used.

### Optimal correction of the output feature

GP-X

GP-A

### We've realized a 25 µs (40,000 times/sec.) ultra high sampling speed

With a 25  $\mu$ s ultra high sampling speed, the **GP-X** series won't miss even high speed work displacements.

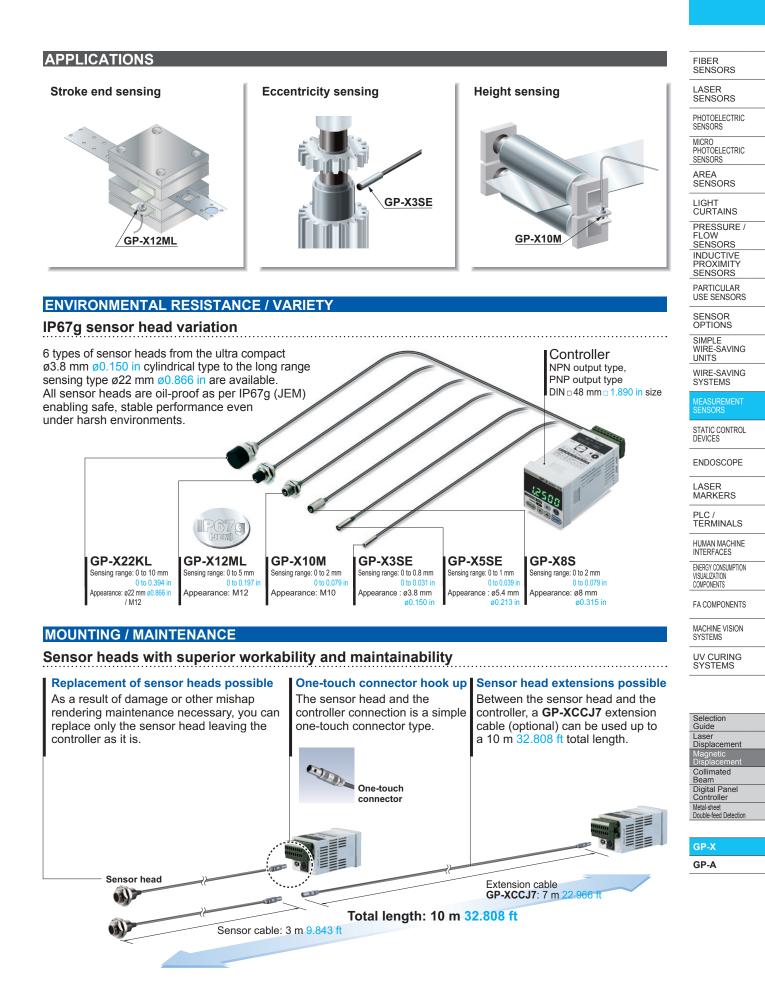

## These devices boast a 0.07 % F.S./°C temperature characteristics

By combining the sensor head with the controller, we've realized 0.07 % F.S./°C. They are highly resistant to ambient temperature changes enabling stable micro-displacement measurements.

## They possess a 0.02 % F.S. resolution for highly accurate measurement

With high resolution, 0.02 % F.S. (Note), they can perform high-accuracy measurements of micro-displacements. In particular, the sensor head **GP-X3SE** for 0.8 mm 0.049 in sensing can differentiate ultra micro displacement of 0.32 µm 0.013 mil (Average number of samples: 64). Note: **GP-XC3SE** and **GP-XC5SE** Resolution: 0.04 % F.S.

### **FUNCTIONS**

### The 5-digit, dual, 2-color digital display offers great visibility

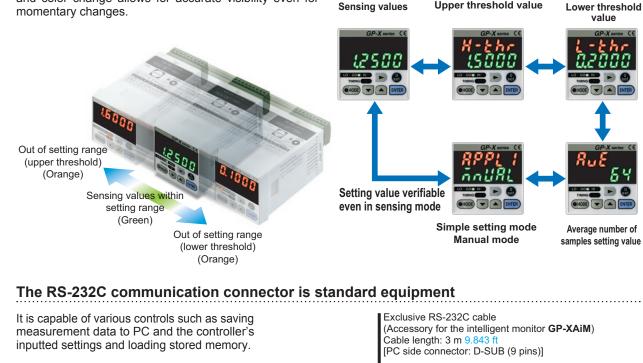

If the measurement results fall within the setting range (GO), they will appear on the lower digital display in green. If they are out of range (HI, LO), they will be displayed in the upper digital display in orange. The display position and color change allows for accurate visibility even for momentary changes.

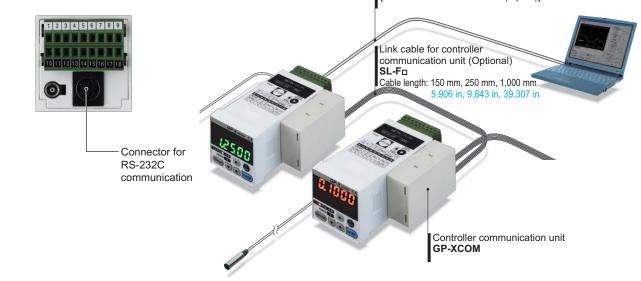

## Digital input display enabling easy setting

Its dual digital display enables numerical setting while verifying setting items for each mode. Even when sensing, it enables the verification of the main settings.

Upper threshold value

.....

### Enables sensors data comparisons and calculations

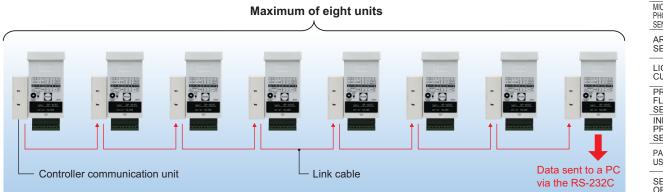

3-value judgment output for calculating measurement data conformity and calculation results between 2 interconnected controllers is rendered possible. The calculation function equipment renders digital panel controllers unnecessary.

## 1026

### OPTIONS

### Datalink between sensors possible

The controller communication unit **GP-XCOM** (optional) can be linked to up to 8 controllers and load via just one RS-232C cable each controller settings and measurement data to a PC.

## An intelligent monitor (GP-XAiM) optimal for collecting and analyzing measurement data is also available

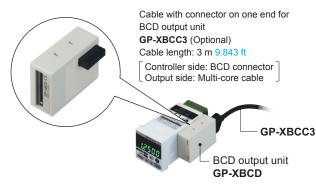

An intelligent monitor capable of the settings for each measurement conditions and waveform display monitoring. It can perform waveform monitoring, which could until now only be done by the oscilloscope, as well as the simple loading and saving onto a PC of settings for each condition and function. (Exclusive RC-232C cable is attached.)

## BCD output unit GP-XBCD (Optional)

### 20 kHz high-speed data output

The measurement data can be processed quickly in the PLC. (Sampling rate: 20 kHz)

### 4 types of measurement modes available

Measurement modes compatible to the most widely used applications are available. Because of this, inputting setting values can be done with ease. Please select the most appropriate mode to suit your specific application. Mutual interference prevention function

The sensor head can be made interference prevention by linking up to 8 controllers via an interference prevention output cable and shifting the oscillation timing. This enables precise measurements to be obtained even in cases where many sensor heads are crowded in the same area.

### Removable type terminal block

It is equipped with a removable type European terminal block very convenient during assembly, when dividing the equipment into segments or when performing maintenance. It also features an reverse insertion prevention construction.

### 4 types of selectable memory functions

The setting data can be processed in 4 types of memory when measuring. This function enables either the changing of the workpiece, the sensing of multiple products or sensing after product changeover to be done smoothly.

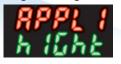

<Stroke end sensing mode>

<Rotation / eccentricity / vibration sensing mode>

<Height sensing mode>

## PRECAUTIONS FOR PROPER USE

· Never use this product as a sensing device for personnel protection.

· In case of using sensing devices for personnel protection, use products which meet laws and standards, such as OSHA, ANSI or IEC etc., for personnel protection applicable in each region or country.

· The sensor head and the controller are adjusted in order to conform to the default specification linearity.

- · In the event of replacing sensor heads, input the sensor head's characteristic code and conduct 3-point correction (calibration).
- Should you use an extension cable, turn the sensor head cable length selection switch located on the back of the controller to "3 m + 7 m 9.843 ft + 22.966 ft". Then reintroduce the power supply and conduct 3-point correction (calibration).

### Conditions in use for CE conformity

 This product is CE compliant and complies with EMC directives. EN 61000-6-2 is the applicable standard that covers immunities relating to use of this product, but in order to comply with this standard, the following conditions must be satisfied.

### Conditions

- The controller should be connected less than 10 m 32.808 ft from the power supply.
- · The signal line to connect with the controller should be less than 30 m 98.425 ft.
- A ferrite clamp must be mounted within 10 mm 0.394 in from connector fitted onto the GP-XBCC3 cable with connector on one end for BCD output units.

### Linearity in case of disc-shaped or cylindrical objects

· In case the sensing object is disc-shaped or cylindrical, the linearity varies with the sensing object size. In the event the sensing object is larger than the sizes indicated in the table below, the linearity specification (within ±0.3 % F.S.) is satisfied by performing zeroadjustment and span adjustment when in contact using the scaling function.

### Mounting sensor head

• The tightening torque should be under the value given below.

#### Mounting with set screw

Make sure to use an M3 or smaller set screw having a cup-point.

Set screw (M3 or less) | / (Cup-point)

-+ / A `	,		
	Model No.	A (mm in)	Tightening torque
	GP-X3SE	4 to 16 0.157 to 0.630	0.10 N·m or less

GP-X12ML	14 0.551 or more	20 N·m or less
GP-X22KL	20 0.787 or more (Note 1)	20 N·m or less

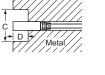

Notes: 1) Without nut, If a nut is installed, the dimension will be 23.5 mm 0.926 in or more 2) Mount such that the nuts do not protrude from the threaded portion.

#### Distance from surrounding metal

· As metal around the sensor head may affect the sensing performance, pay attention to the following points.

### <Embedding of the sensor head in metal>

 Since the analog output may change if the sensor head is completely embedded in metal, keep the minimum distance specified in the table below.

ø10 ø0.394		
010 00.394	2.0.440	
ø18 ø0.709	3 0.118	
ø14 ø0.551

### Mutual interference

· If several sensor heads are mounted close together, some specifications may not be satisfied. Therefore, proceed with the interference prevention function enabled.

The interference prevention function eliminates interference among sensors by alternating sensor oscillations. Contact our office for details about time charts etc. If not using the interference prevention function, leave a distance more than the values given below.

### <Face to face mounting>

<face face="" mounting="" to=""></face>	Sensor head
→ E ←	GP-X3SE
	GP-X5SE
<parallel mounting=""></parallel>	GP-X8S
	GP-X10M
 F	GP-X12ML
	GP-X22KL
I	

### Sensing range

· The sensing range is specified for the standard sensing object [stainless steel (SUS304) / iron [Cold rolled carbon steel (SPCC)], 60 × 60 × t 1 mm 2.362 × 2.362 × t 0.039 in]. For sensing metals other than the standard sensing objects, use the correction coefficient stated below as a guideline. Verify with the actual sensor before using.

#### **Correction coefficient**

Sensor head Metal	GP-X3SE GP-X5SE GP-X8S GP-X10M GP-X12ML GP-X22KL
Stainless steel (SUS304), Iron	1
Aluminum	0.5 approx.

#### Others

· After turning on the power, wait 15 min. or more [20 min.for the GP-XC3SE(-P) and GP-XC5SE(-P)] before using the product. The power supply circuit is not stable immediately after the power is turned on, and this may cause measurement values to be distorted. In addition, note that there will also be a muting period of approx. 2 sec.
