

690+ Series Frequency Inverter

Software Product Manual

HA465038U005 Issue 2

Compatible with Version 5.x Software

© Copyright Eurotherm Drives Limited 2003

All rights strictly reserved. No part of this document may be stored in a retrieval system, or transmitted in any form or by any means to persons not employed by a Eurotherm Drives company without written permission from Eurotherm Drives Ltd.

Although every effort has been taken to ensure the accuracy of this document it may be necessary, without notice, to make amendments or correct omissions. Eurotherm Drives cannot accept responsibility for damage, injury, or expenses resulting therefrom.

WARRANTY

Eurotherm Drives warrants the goods against defects in design, materials and workmanship
for the period of 12 months from the date of delivery on the terms
detailed in Eurotherm Drives Standard Conditions of Sale IA058393C.

Eurotherm Drives reserves the right to change the content and product specification without notice.

Safety Information

Requirements

IMPORTANT: Please read this information BEFORE installing the equipment.

Intended Users

This manual is to be made available to all persons who are required to install, configure or service equipment described herein, or any other associated operation.

The information given is intended to highlight safety issues, and to enable the user to obtain maximum benefit from the equipment.

Complete the following table for future reference detailing how the unit is to be installed and used.

INSTALLATION DETAILS	
Serial Number (see product label)	
Where installed (for your own information)	
Unit used as a: (refer to Certification for the Inverter)	<input type="checkbox"/> Component <input type="checkbox"/> Relevant Apparatus
Unit fitted:	<input type="checkbox"/> Wall-mounted <input type="checkbox"/> Enclosure

Application Area

The equipment described is intended for industrial motor speed control utilising AC induction or AC synchronous machines.

Personnel

Installation, operation and maintenance of the equipment should be carried out by qualified personnel. A qualified person is someone who is technically competent and familiar with all safety information and established safety practices; with the installation process, operation and maintenance of this equipment; and with all the hazards involved.

Safety Information

Hazards

WARNING!

This equipment can endanger life through rotating machinery and high voltages. Failure to observe the following will constitute an ELECTRICAL SHOCK HAZARD. This is a product of the restricted sales distribution class according to IEC 61800-3. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures. This product is designated as "professional equipment" as defined in EN61000-3-2. Permission of the supply authority shall be obtained before connection to the low voltage supply.

- The equipment must be **permanently earthed** due to the high earth leakage current.
- The drive motor must be connected to an appropriate safety earth.
- The equipment contains high value capacitors which take time to discharge after removal of the mains supply.
- Before working on the equipment, ensure isolation of the mains supply from terminals L1, L2 and L3. Wait for at least 3 minutes for the dc link terminals (DC+ and DC-) to discharge to safe voltage levels (<50V). Measure the DC+ and DC- terminal voltage with a meter to confirm that the voltage is less than 50V.
- Never perform high voltage resistance checks on the wiring without first disconnecting the drive from the circuit being tested.
- When replacing a drive in an application and before returning to use, it is essential that all user defined parameters for the product's operation are correctly installed.
- This equipment contains electrostatic discharge (ESD) sensitive parts. Observe static control precautions when handling, installing and servicing this product.

IMPORTANT: Metal parts may reach a temperature of 90 degrees centigrade in operation.

Application Risk

The specifications, processes and circuitry described herein are for guidance only and may need to be adapted to the user's specific application.

Eurotherm Drives does not guarantee the suitability of the equipment described in this Manual for individual applications.

Risk Assessment

Under fault conditions, power loss or other operating conditions not intended, the equipment may not operate as specified. In particular:

- The motor speed may not be controlled
- The direction of rotation of the motor may not be controlled
- The motor may be energised

Guards

The user must provide guarding and /or additional safety systems to prevent risk of injury and electric shock.

Protective Insulation

- All control and signal terminals are SELV, i.e. protected by double insulation. Ensure all wiring is rated for the highest system voltage.

Note: *Thermal sensors contained within the motor must be double insulated.*

- All exposed metalwork in the Inverter is protected by basic insulation and bonding to a safety earth.

RCDs

These are not recommended for use with this product but ,where their use is mandatory, only Type B RCDs should be used.

PROGRAMMING YOUR APPLICATION

Introducing the Macro

You can program the Inverter for specific applications.

The Inverter is supplied with macros (set-ups) which can be used as starting points for application-specific programming. This programming could simply involve the inputting of parameter values, or it may require the making or breaking of programmable links, which is a feature of this unit.

Each macro recalls a pre-programmed set of default parameters and links when it is loaded.

Refer to Chapter 5: "Application Macros" for further information.

Programming with Block Diagrams

Block diagram programming provides a visual method of planning the software to suit your application. There are block diagrams provided at the end of this chapter, each showing the software connections for an application macro. These pages replicate the ConfigED Lite programming screens. ConfigED Lite is Eurotherm's own programming tool.

The processes performed by a macro are represented as a block diagram, consisting of *function blocks* and *links*:

- Each function block contains the parameters required for setting-up a particular processing feature. Sometimes more than one instance of a function block is provided for a feature, i.e. for multiple digital inputs.
- Software links are used to connect the function blocks. Each link transfers the value of an output parameter to an input parameter of another (or the same) function block.

Each individual block is a processing feature, i.e. it takes the input parameter, processes the information, and makes the result available as one or more output parameters.

Modifying a Block Diagram

Configuration and Parameterisation Modes

There are two modes of operation used while modifying a block diagram:
Configuration and *Parameterisation* modes.

Configuration Mode

In the configuration mode you can modify the links in the function block diagram. You can also change parameter values, as above. This mode is indicated by all the LEDs on the operator station flashing at once. The Inverter cannot run in this mode.

When you attempt to change a parameter value requiring Configuration Mode to be enabled, the Operator Station immediately displays ENABLE CONFIG. Refer to Figure 1-1, page 1-2. Press the E key at this point if you do not want to enter Configuration Mode. Press the ▲ (up) key as instructed to enter Configuration Mode. This is indicated by all LEDs flashing.

Parameterisation Mode

In parameterisation mode you can change parameter values. The Inverter can be running or stopped. Note that some parameters can only be changed when the Inverter is stopped. It is not possible to modify the internal links when the Inverter is in parameterisation mode.

Once in Configuration Mode, to return to Parameterisation Mode simply press the E key repeatedly until the Welcome screen is displayed. Press the E key again and Configuration Mode will be disabled. This is indicated by LEDs ceasing to flash.

DEFAULT

1-2 Programming Your Application

Making and Breaking Links in Configuration Mode

Links can be moved, added or deleted from a block diagram whilst in the Configuration mode. There are 80 links available, each has its own identification number (“link” number). You make a link by setting the link’s SOURCE and DESTINATION to be the two parameter names to be linked. The outputs of function blocks are not updated whilst in this mode.

Note: Menus and parameters are displayed in alphabetical order. NULL is placed between A and Z. Setting both SOURCE and DESTINATION to NULL disables the link.

The LINK Parameter

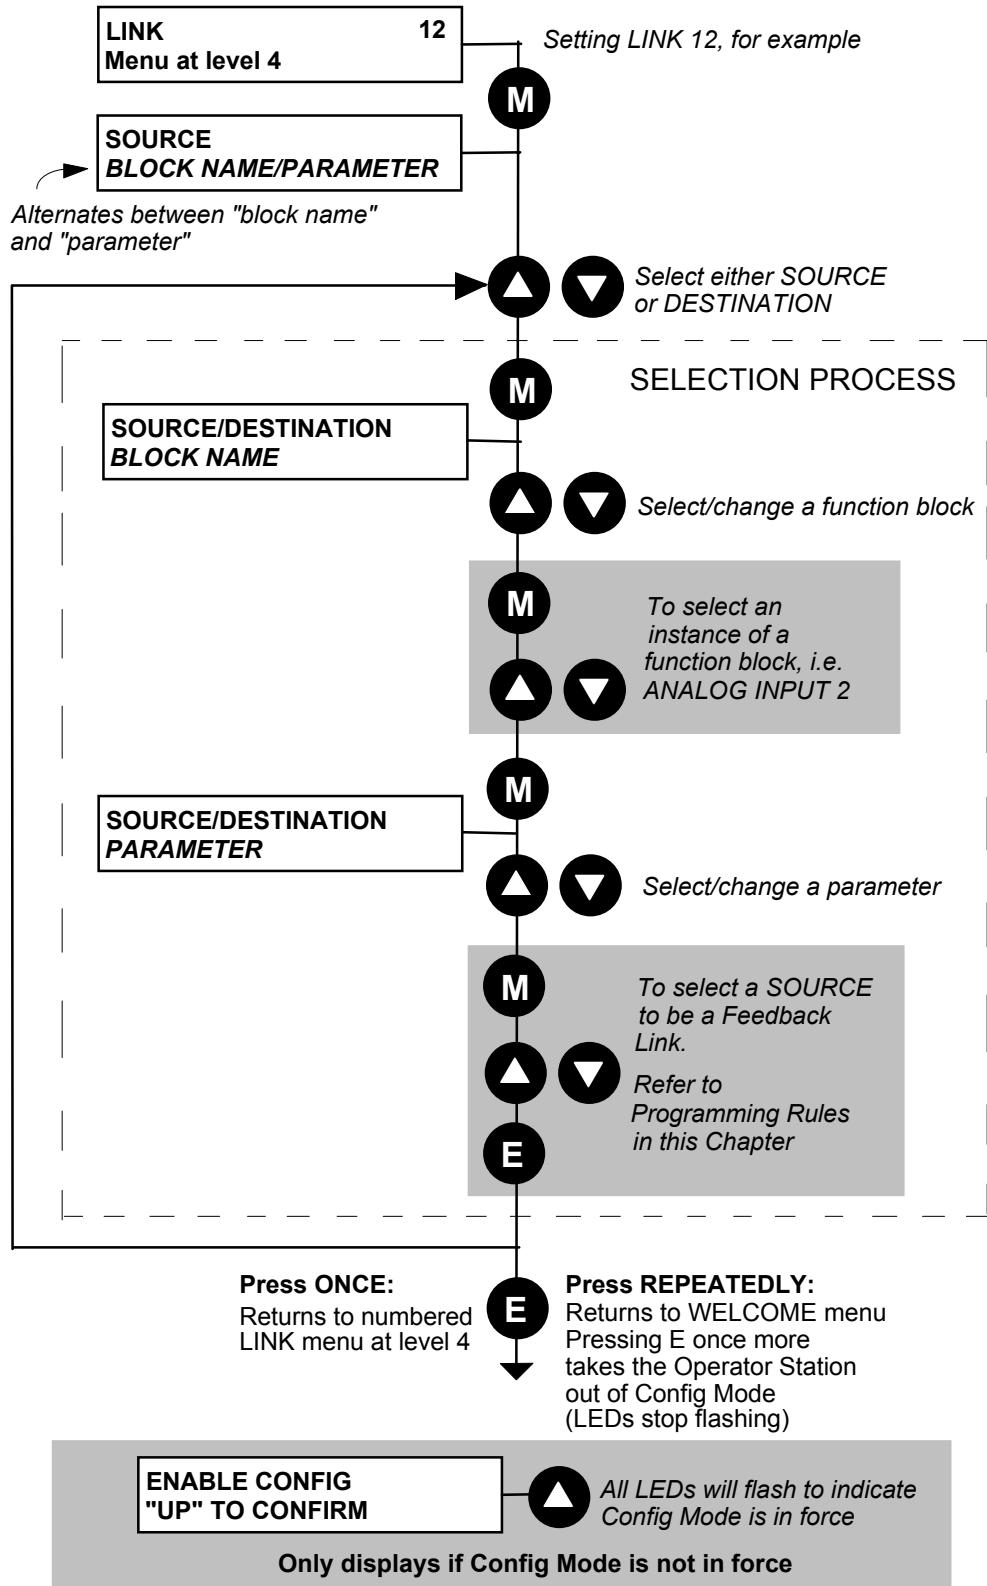

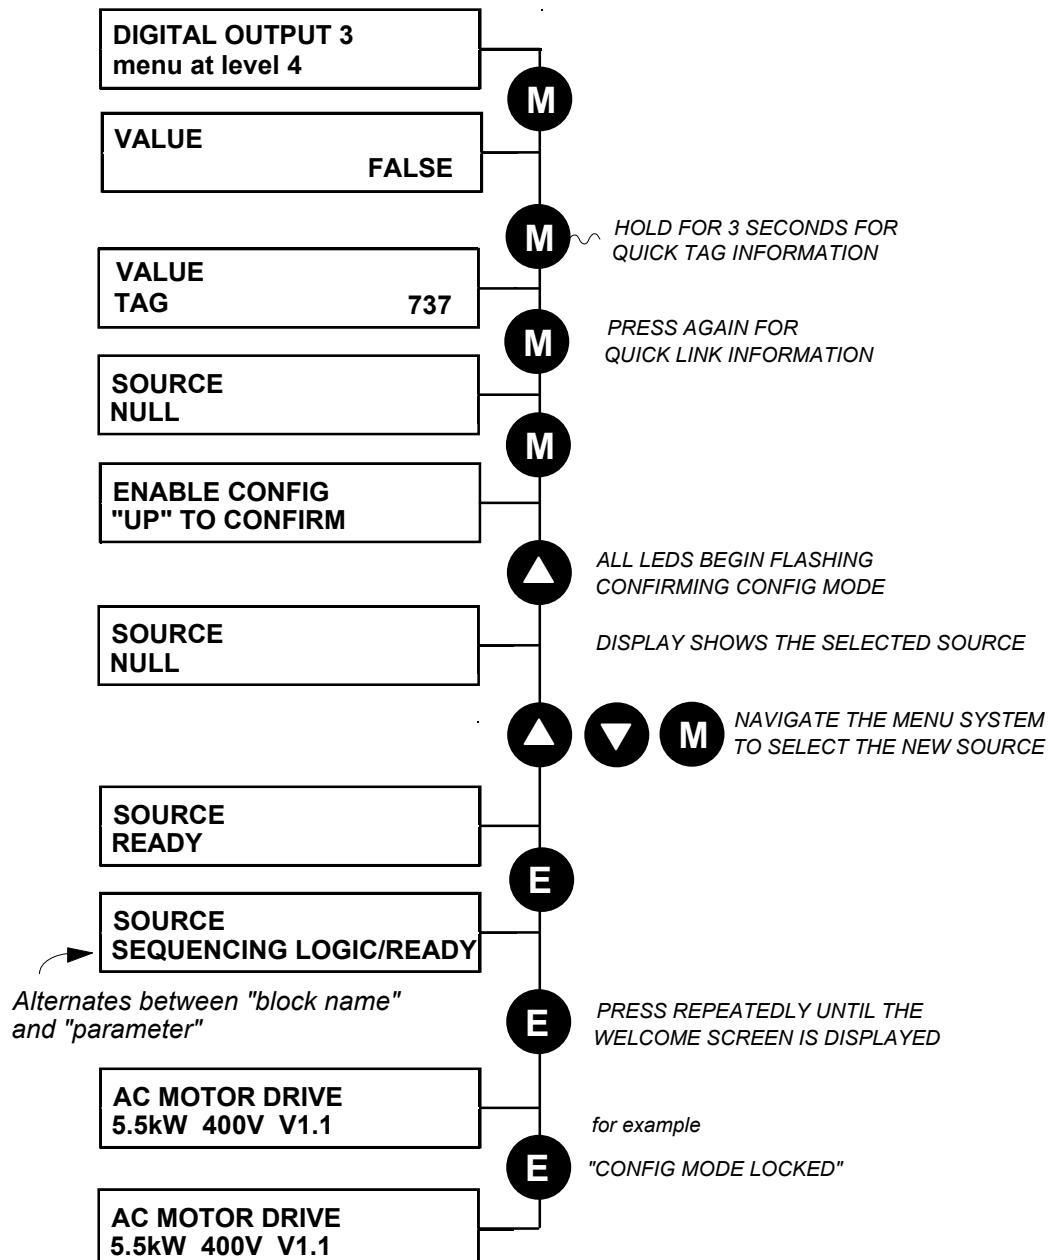

Figure 1-1 Diagram showing Key Presses for Making/Breaking Links

Any Configurable “Destination” Parameter

A similar process can be used to apply or edit a link to any configurable parameter that is to be the intended “destination”. The process selects the “source” for the link.

Note: It is possible for several “destination” parameters to share the same “source”.

1-4 Programming Your Application

Programming Rules

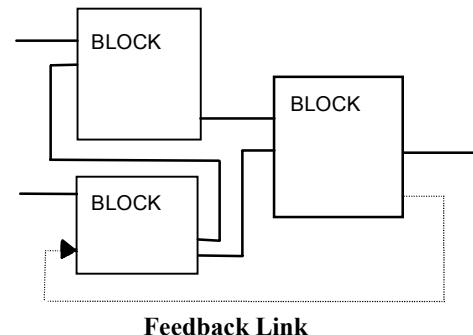

The following rules apply when programming:

Parameterisation Mode

- Function block output parameter values cannot be changed (because they are a result of the function block's processing)
- Function block input parameter values that receive their values from a link cannot be changed (as they will change back to the value they receive from the link when the Inverter is running).

Configuration Mode

- A link's DESTINATION must be set to an input parameter (only one link per input parameter).
- A link's SOURCE may be set to any parameter. Both input and output parameters can be used as a source.
- Disable a link by setting both DESTINATION and SOURCE to NULL.
- Setting a link's SOURCE to be a *feedback link* forces the link to be executed first. This is used to reduce execution timing delays in a feedback loop situation. A feedback link is indicated by “<“ appearing to the right of the source parameter's name.

Feedback Link

Execution Rules

The complete block diagram is executed every 5ms, with individual control blocks executing within 1ms. Just before a function block is executed, all the links that have that block as their destination are executed, thereby copying new values in to the block's parameter inputs. The input parameters are then processed to produce a new set of output parameters. The execution order of the blocks is automatically arranged for minimal delay.

- The output value transferred by a link on execution is clamped to be between the maximum and minimum value for its destination input parameter.
- If a links' SOURCE and DESTINATION parameters have different decimal point positions, there is no automatic adjustment. Use a VALUE FUNCTION block to modify the input into the correct destination format. Refer to the table below for the result of linking different parameters types.

Source Value (the input)	Source Type	Destination Type	Destination Value (the result)
TRUE	Boolean	Real	0.01
FALSE	Boolean	Real	0.00
≥ 0.005	Real	Boolean	TRUE
≤ 0.005	Real	Boolean	FALSE
LOCAL ONLY (1)	Enumerated	Real	1.00
2.00	Real	Enumerated	REMOTE ONLY (2) (Note that (2) will not always return Remote Only)

Table 1-1 Execution Rules

Saving Your Modifications

If parameter values or links have been modified or a macro has been loaded, the new settings must be saved. The Inverter will then retain the new settings during power-down. Refer to the Installation Product Manual, Chapter 5: "The Operator Station" - Saving/Restoring/Deleting Your Application.

SETUP Menu - Function Block Descriptions

Note: To view the SETUP Menu, ADVANCED view level must be selected.

Understanding the Function Block Description

The following function blocks show the parameter information necessary for programming the Inverter.

Input parameters are shown on the left hand side, and output parameters are shown on the right hand side of the block.

The diagrams assume that the UK country code is selected and that a 400V 5.5kW Frame C power board is fitted. This is reflected in the values of certain parameters, see “*” and “**” in the table below.

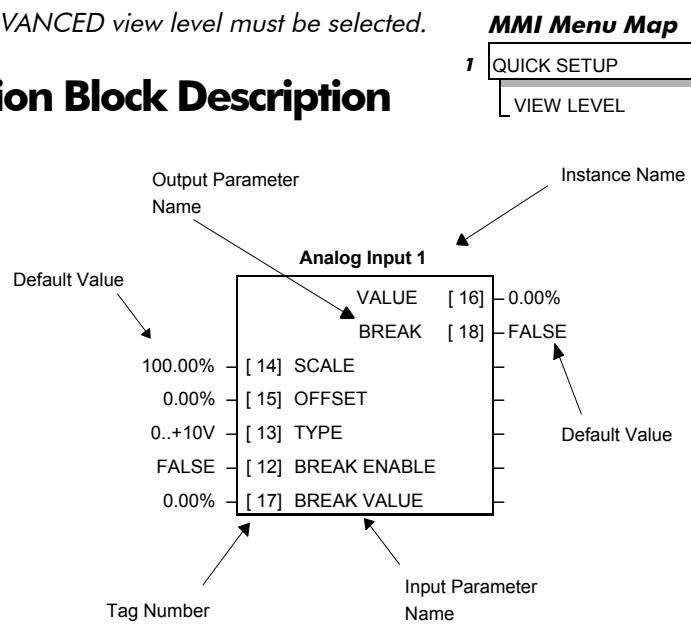

Figure 1-2 Function Block Parameter Information

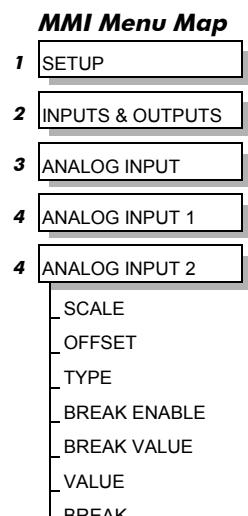

Instance Name	Names the function block and MMI menu
Default Value	The default value of the unmodified macro, Macro 0
Input/Output Parameter Name	The name shown on ConfigEd Lite
Tag Number	Unique identification used for communications
*	Parameters marked with “*” are set to a value depending upon the “operating frequency” of the drive. Refer to Chapter 2: “Parameter Specification” - Frequency Dependent Defaults; and the Installation Product Manual, Chapter 5: “The Operator Station” - Changing the Product Code (3-button reset).
**	Parameters marked with “**” are set to a value depending on the overall “power build” of the Inverter indicated by the product code. Refer to Chapter 2: “Parameter Specification” - Power Dependent Defaults; and the Installation Product Manual: Chapter 2: “Understanding the Product Code”.

Note: The “Range” for a parameter value is given in the Parameter Description Table on each Function Block page. Ranges for outputs are given as “—.xx %”, for example, indicating an indeterminate integer for the value, to two decimal places.

MMI Menu Maps

The function block descriptions include an easy-find menu showing the menu levels and titles encountered to find the appropriate menu title, and the parameters contained in the menu(s).

Where there is more than one instance, i.e. ANALOG INPUT as illustrated, the parameters shown will be for the last instance.

1-6 Programming Your Application

Function Blocks by Category

The function block descriptions in this chapter are arranged in alphabetical order, however, they are listed below by Category. They each appear as a Menu in the SETUP menu at level 1. To view the SETUP Menu, ADVANCED view level must be selected.

Communications			
5703 INPUT	1-7	SYSTEM PORT (P3)	1-114
5703 OUTPUT	1-8	TEC OPTION	1-118

Function Blocks in Alphabetical Order

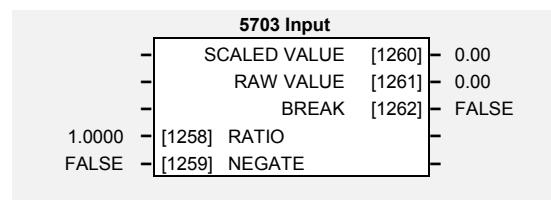

MMI Menu Map

- 1 SETUP
- 2 COMMUNICATIONS
- 3 5703 INPUT
 - RATIO
 - NEGATE
 - SCALED VALUE
 - RAW VALUE
 - BREAK

5703 INPUT

Supports the receiving of data from a Eurotherm 5703 Setpoint Repeater.

This block is only operational when the SYSTEM PORT (P3) :: MODE parameter is set to 5703. Refer to page 1-114.

Parameter Descriptions

RATIO

Range: -3.0000 to 3.0000 %

Scaler applied to RAW VALUE to produce SCALED VALUE output.

NEGATE

Range: FALSE / TRUE

When TRUE, changes the sign of SCALED VALUE

SCALED VALUE

Range: _xx

Received value with RATIO and NEGATE applied.

RAW VALUE

Range: _xx

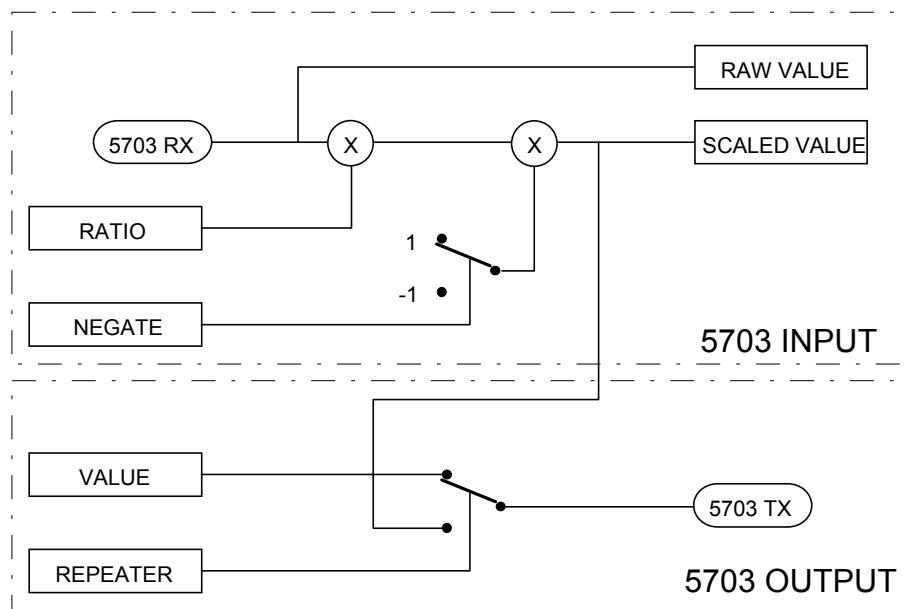

Received value before any processing. Reset to zero when there are no valid received messages.

BREAK

Range: FALSE / TRUE

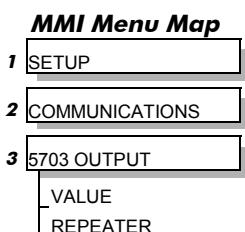

Set TRUE when there are no valid 5703 messages received during the previous 2 seconds.

Functional Description

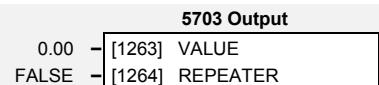

1-8 Programming Your Application

5703 OUTPUT

Supports the sending of data to a Eurotherm 5703 Setpoint Repeater.

This block is only operational when the SYSTEM PORT (P3) :: MODE parameter is set to 5703. Refer to page 1-114.

Parameter Descriptions

VALUE

Range: -300.00 to 300.00 %

The value to be sent when not configured as a repeater.

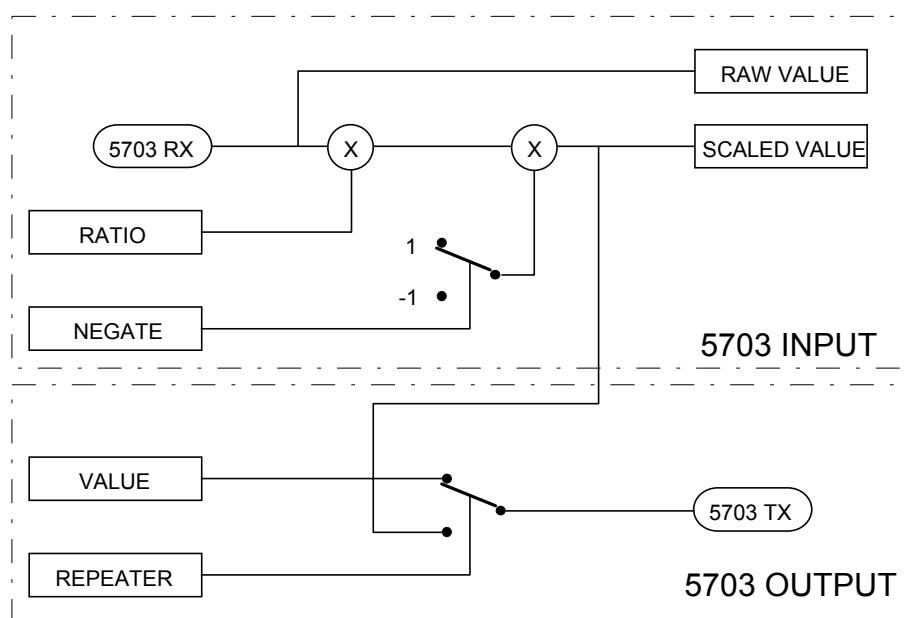

REPEATER

Range: FALSE / TRUE

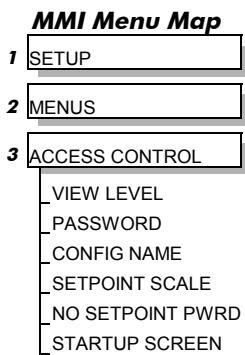

When TRUE, sends the SCALED VALUE from the 5703 INPUT block instead of the VALUE input.

Note: This is performed at a faster rate than the block diagram execution to minimise the transmission delay between drives.

Functional Description

ACCESS CONTROL

This function block contains options associated with operator station password protection, view levels, setpoint display and initial Operator Menu selection.

Access Control	
BASIC	[876] VIEW LEVEL
0000	[8] PASSWORD
	[339] CONFIG NAME
NONE	[1037] SETPOINT SCALE
FALSE	[1038] NO SETPOINT PWRD
0	[93] STARTUP SCREEN

Parameter Descriptions

VIEW LEVEL

Range: FALSE / TRUE

The menu to be displayed by the Operator Station. Refer to the Installation Product Manual, Chapter 5: "The Operator Station" - Menu Viewing Levels.

- Enumerated Value : View Level*
- 0 : OPERATOR
 - 1 : BASIC
 - 2 : ADVANCED

PASSWORD

Range: 0000 to FFFF

Setting a non-zero value enables the password feature.

CONFIG NAME

Range: max length is 16 chars

When not blank, the string is displayed as the top line of the Welcome screen.

SETPOINT SCALE

Range: See below

A scaling factor applied to the speed setpoint and feedback displays. Selects a DISPLAY SCALE function block to be applied.

- Enumerated Value : DISPLAY SCALE function block*
- 0 : NONE
 - 1 : DISPLAY SCALE 1
 - 2 : DISPLAY SCALE 2
 - 3 : DISPLAY SCALE 3
 - 4 : DISPLAY SCALE 4

NO SETPOINT PWRD

Range: FALSE / TRUE

When TRUE, the local setpoint is not password protected, regardless of the PASSWORD value. When FALSE, the local setpoint is password protected just like all other parameters.

STARUP SCREEN

Range: See below

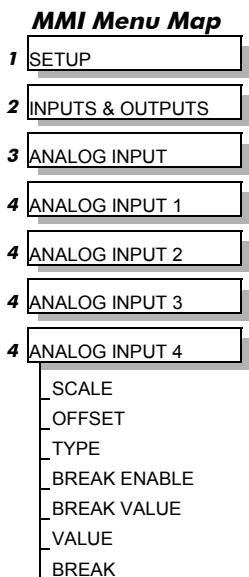

Selects which of the Operator Menu parameters will be displayed after the Welcome screen.

- Enumerated Value : Startup Screen*

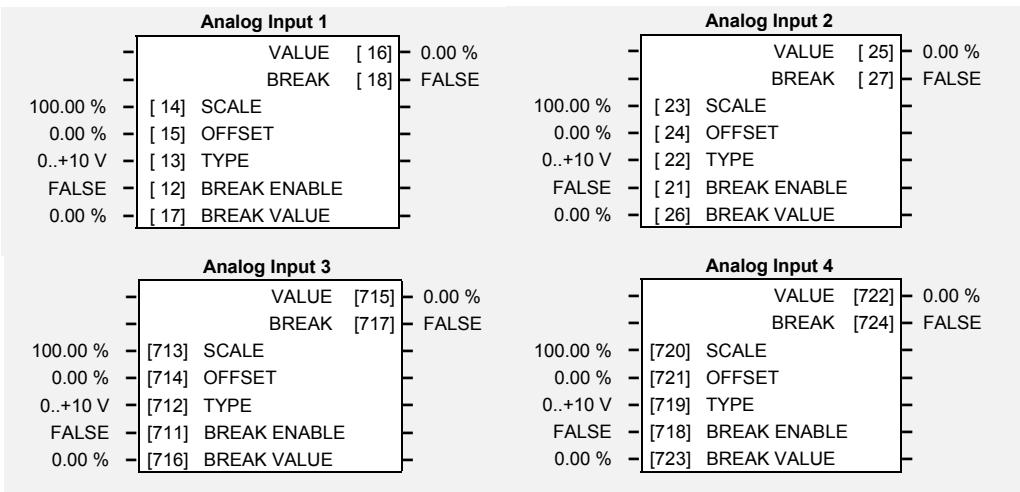

- 0 : selects REMOTE SETPOINT or LOCAL SETPOINT
- 1 : selects parameter defined by OPERATOR MENU 1
- 2 : selects parameter defined by OPERATOR MENU 2
: etc.
- 16 : selects parameter defined by OPERATOR MENU 16

1-10 Programming Your Application

ANALOG INPUT

The analog input block converts the input voltage or current into a value expressed as a percentage of a configurable range.

Parameter Descriptions

SCALE

Range: -300.00 to 300.00 %

A scaling factor applied to the raw input. With a scaling factor of 100.00% and an offset of 0.00%, an input equal to the low input range will appear as a value of 0.00%. Similarly, an input equal to the high input range will appear as a value of 100.00%.

OFFSET

Range: -300.00 to 300.00 %

An offset added to the input after the scaling factor has been applied.

TYPE

Range: Enumerated - see below

The input range and type.

- ANALOG INPUT 1 and ANALOG INPUT 2 support all types.
- ANALOG INPUT 3 and ANALOG INPUT 4 are used for voltage measurement only.

Enumerated Value : Type

- 0 : 0..+10 V
- 1 : +2..+10 V
- 2 : 0..+5 V
- 3 : +1..+5 V
- 4 : -10..+10 V
- 5 : 0..20 mA
- 6 : 4..20 mA
- 7 : 20..4 mA
- 8 : 20..0 mA
- 9 : 0..+20 V

BREAK ENABLE*Range: FALSE / TRUE*

For input types that support sensor break detection (see Functional Description below), this parameter may be used to disable sensor break detection. For input types that do not support break detection, this parameter is FALSE.

BREAK VALUE*Range: -300.00 to 300.00 %*

The value that will appear as the VALUE output when BREAK is TRUE

VALUE*Range: —.xx %*

The input reading with scaling and offset applied.

BREAK*Range: FALSE / TRUE*

Indicates that the input sensor signal is not present. See below for more details on break detection.

Functional Description

The Inverter has four analog inputs. There is an analog input function block for each:

ANALOG INPUT 1 is associated with the signal on terminal 2

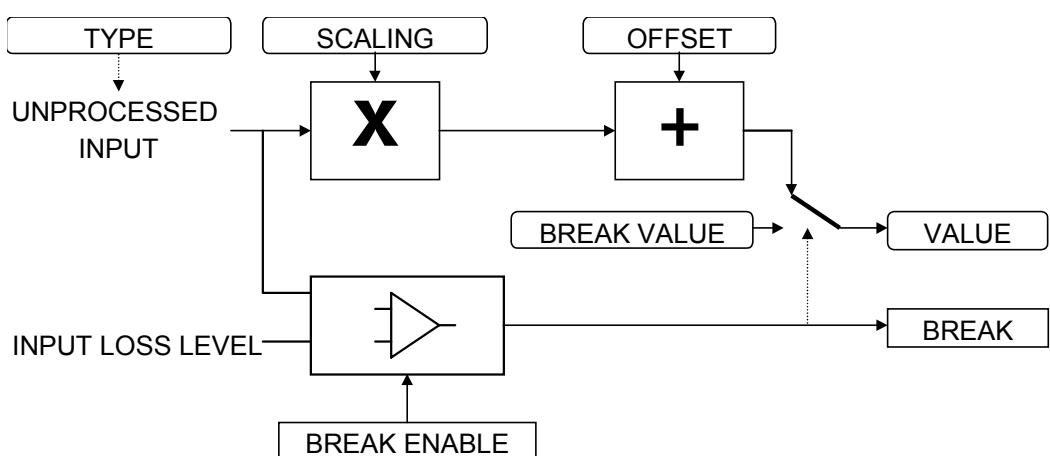

ANALOG INPUT 2 is associated with the signal on terminal 3

ANALOG INPUT 3 is associated with the signal on terminal 4

ANALOG INPUT 4 is associated with the signal on terminal 5

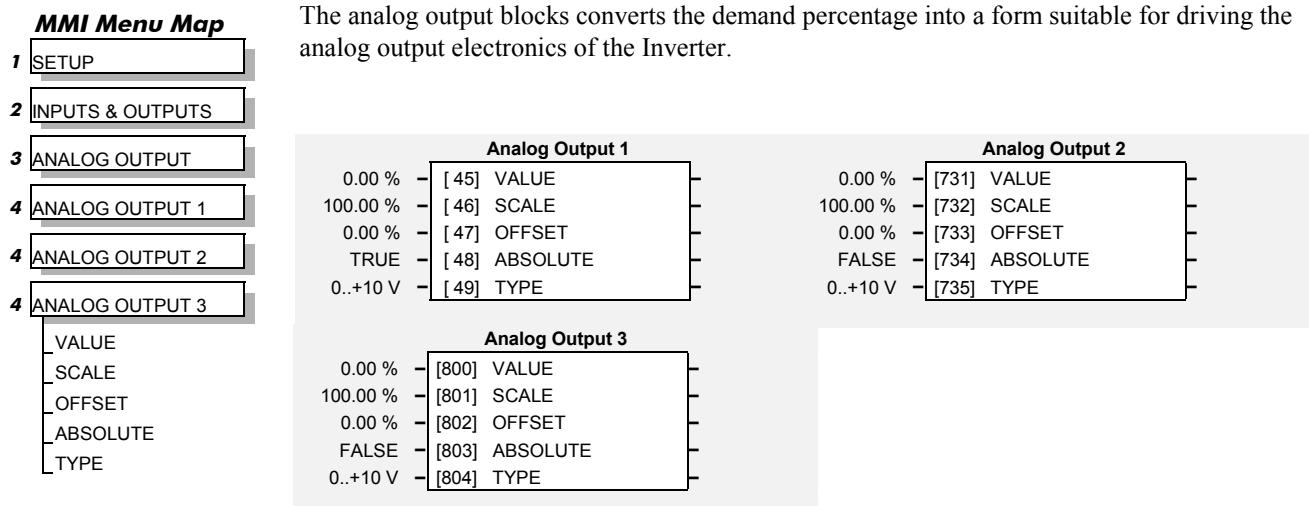

The input voltage is pre-processed and converted into a numeric value by the analog input electronics of the Inverter. The analog input function blocks further process this reading so that a value of 0.00% represents an input equal to the low input range, while a value of 100.00% represents an input equal to the high input range. The SCALE and OFFSET factors are then applied as shown to produce a value suitable for use in the application.

The break detect facility may only be used in conjunction with the following hardware ranges: 2 to 10V, 1 to 5V, 4 to 20mA and 20 to 4mA. An input break is defined as an input reading less than either 0.1V or 0.45mA. When an input break has been detected, the VALUE output is forced to be the BREAK VALUE.

1-12 Programming Your Application

ANALOG OUTPUT

Parameter Descriptions

VALUE

Range: -300.00 to 300.00 %

The demanded value to output.

SCALE

Range: -300.00 to 300.00 %

A scaling factor to apply to VALUE . A scaling factor of 100.00% has no effect.

OFFSET

Range: -300.00 to 300.00 %

An offset added to VALUE after the scaling factor has been applied. An offset factor of 0.00% has no effect.

ABS

Range: FALSE / TRUE

When true the output sign is ignored.

TYPE

Range: Enumerated - see below

The output hardware type, either Volts or Amps.

- ANALOG OUTPUT 1 supports all types, except -10..+10V.
- ANALOG OUTPUT 2 and ANALOG OUTPUT 3 are used as voltage outputs only.

An incorrect selection will force the VALUE to be set to zero.

Enumerated Value : Type

0	: 0..+10 V
1	: 0..20 mA
2	: 4..20 mA
3	: -10..+10 V
4	: 20..4 mA
5	: 20..0 mA
6	: +2..+10 V
7	: 0..+5 V
8	: +1..+5 V

Functional Description

The Inverter has three analog outputs. There is an ANALOG OUTPUT function block associated with each of these:

ANALOG OUTPUT 1 is associated with terminal 6

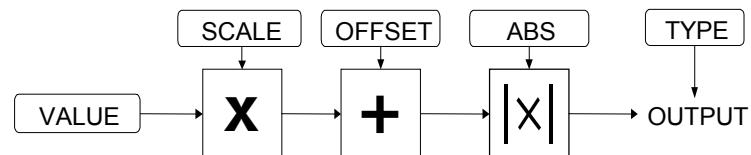

ANALOG OUTPUT 2 is associated with terminal 7

ANALOG OUTPUT 3 is associated with terminal 8

The scaling and offset parameters are applied to the demand value as shown.

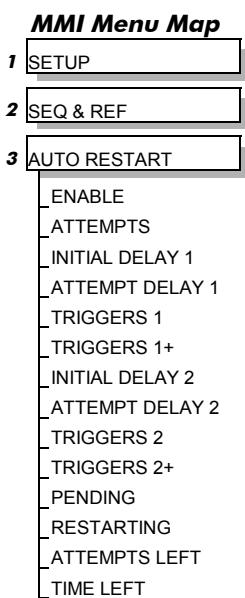

If ABS is TRUE then the final output is the magnitude of value after being scaled and offset.

If ABS is FALSE then the final output will be limited to be within the range selected by TYPE.

1 - 14 Programming Your Application

AUTO RESTART

Auto Restart (or Auto Reset) provides the facility to automatically reset a choice of trip events and restart the drive with a programmed number of attempts, after which, a manual or remote trip reset is required if the drive is not successfully restarted. The number of attempted restarts are recorded. This count is cleared after a trip-free period of operation (5 minutes or 4 x ATTEMPT DELAY 1, whichever is the longer), or after a successful manual or remote trip reset, or by removing the Run signal, or by setting the ENABLE input to this block FALSE.

Auto Restart	
PENDING	[608]
RESTARTING	[616]
ATTEMPTS LEFT	[614]
TIME LEFT	[615] 0.0 s
FALSE	
5	[611] ENABLE
10.0 s	[612] ATTEMPTS
	[610] INITIAL DELAY 1
	[613] ATTEMPT DELAY 1
0000	[609] TRIGGERS 1
0000	[744] TRIGGERS 1+
0.1 s	[678] INITIAL DELAY 2
0.1 s	[679] ATTEMPT DELAY 2
0000	[677] TRIGGERS 2
0000	[745] TRIGGERS 2+

Parameter Descriptions

ENABLE

Enables operation of the auto restart feature.

Range: FALSE / TRUE

ATTEMPTS

Determines the number of restarts that will be permitted before requiring an external fault reset.

Range: 1 to 10

Determines the delay for the first restart attempt when the trip is included in TRIGGERS 1 . The delay is measured from all error conditions clearing.

Range: 0.0 to 600.0 s

ATTEMPT DELAY 1

Determines the delay between restart attempts for a trip included in TRIGGERS 1 . The delay is measured from all error conditions clearing.

Range: 0.0 to 600.0 s

TRIGGERS 1 and TRIGGERS+ 1

Range: 0000 to FFFF

Allows Auto Restart to be enabled for a selection of trip conditions.

Refer to the Installation Product Manual, Chapter 6: "Hexadecimal Representation of Trips" for an explanation of the four-digit codes.

INITIAL DELAY 2

Range: 0.0 to 600.0 s

Determines the delay for the first restart attempt when the trip is included in TRIGGERS 2 . The delay is measured from all error conditions clearing.

ATTEMPT DELAY 2

Range: 0.0 to 600.0 s

Determines the delay between restart attempts for a trip included in TRIGGERS 2 . The delay is measured from all error conditions clearing.

TRIGGERS 2 and TRIGGERS+ 2

Range: 0000 to FFFF

Allows Auto Restart to be enabled for a selection of trip conditions.

If a trip is included in both TRIGGERS 1 and TRIGGERS 2 , then the times associated with TRIGGERS 1 will take priority.

Refer to the Installation Product Manual, Chapter 6: "Hexadecimal Representation of Trips" for an explanation of the four-digit codes.

PENDING*Range: FALSE / TRUE*

Indicates that an auto restart will occur after the programmed delay.

RESTARTING*Range: FALSE / TRUE*

Indicates that an auto restart is occurring. TRUE for a single block diagram execution cycle.

ATTEMPTS LEFT*Range: —.*

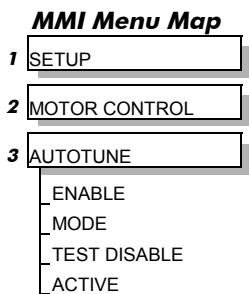

Indicates the number of attempts left before an external fault reset is required.

TIME LEFT*Range: —.x s*

When in the Restarting state, this parameter indicates the time left before an auto restart attempt will be permitted. When non-zero, this value is unaffected by changes to ATTEMPT DELAY 1.

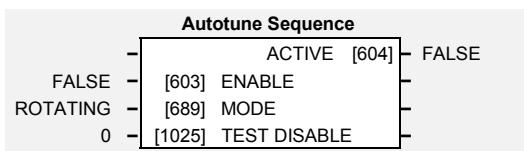

1-16 Programming Your Application

AUTOTUNE

Designed for SENSORLESS VEC and CLOSED-LOOP VEC Motor Control Modes.

The auto-tune is an automatic test sequence performed by the inverter to identify motor model parameters. The motor model is used by the Sensorless Vector and Closed-Loop Vector control modes. You **MUST** perform an auto-tune before operating the inverter in either of the Vector control modes.

Refer to the Installation Product Manual, Chapter 4: "Operating the Inverter" - Set-up using the Sensorless Vector Fluxing Mode.

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

Determines whether the Autotune sequence is operational or not. The Autotune sequence is operational when set to TRUE and the drive is run. Refer to the Installation Product Manual, Chapter 4: "Operating the Inverter" - The Autotune Feature.

MODE

Range: Enumerated - see below

Selects the Autotune operating mode. Refer to the Installation Product Manual, Chapter 4: "Operating the Inverter" – The Autotune Feature.

Enumerated Value : Mode

- 0 : STATIONARY
- 1 : ROTATING

TEST DISABLE

Range: 0 to 4

This parameter expands on the MMI to show four tests. Each test can be individually disabled by setting to TRUE.

Enumerated Value : Mode

- 0 : STATOR RES
- 1 : LEAKAGE IND
- 2 : ENCODER DIR
- 3 : MAG CURRENT
- 4 : ROTOR TIME CONST

ACTIVE

Range: FALSE / TRUE

This indicates the current state of the Autotune sequence. The Autotune sequence is operational when displaying TRUE.

Functional Description

The autotune sequence identifies the following motor parameters:-

- Per-phase stator resistance (STATOR RES)
- Per-phase leakage inductance (LEAKAGE INDUC)
- Per-phase mutual inductance (MUTUAL INDUC)
- Rotor time constant (ROTOR TIME CONST)
- No-load magnetising line current (MAG CURRENT)
- The encoder direction (ENCODER INVERT)

The Rotating autotune sequence rotates the motor up to the user-programmed MAX SPEED (SETPOINT SCALE function block) in order to identify these parameters.

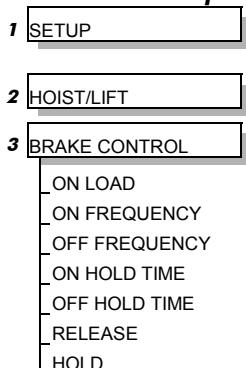

The Stationary autotune sequence does not rotate the motor and requires the correct value of Magnetising Current to be entered.

The values of the above are stored in the MOTOR DATA function block. Autotune will overwrite any previous entry made for these parameters.

Autotune can only be initiated from the "stopped" condition. When the test is complete, the stack is disabled and ENABLE is set to FALSE.

BRAKE CONTROL

MMI Menu Map

This is used to control electro-mechanical motor brakes in hoist and lift applications.

Brake Control	
RELEASE [589]	FALSE
HOLD [590]	FALSE
50.00 %	
[584] ON LOAD	
5.0 Hz	
[585] ON FREQUENCY	
3.0 Hz	
[586] OFF FREQUENCY	
0.00 s	
[587] ON HOLD TIME	
0.00 s	
[588] OFF HOLD TIME	

Parameter Descriptions

ON LOAD

Range: 0.00 to 150.00 %

Load level at which the external motor brake is released.

ON FREQUENCY

Range: 0.0 to 500.0 Hz

The output electrical frequency at which the external motor brake is released.

OFF FREQUENCY

Range: 0.0 to 500.0 Hz

The output electrical frequency at which the external motor brake is applied.

ON HOLD TIME

Range: 0.00 to 60.00 s

Sets the duration of the pulse output on HOLD when RELEASE becomes TRUE.

OFF HOLD TIME

Range: 0.00 to 60.00 s

Sets the duration of the pulse output on HOLD when RELEASE becomes FALSE.

RELEASE

Range: FALSE / TRUE

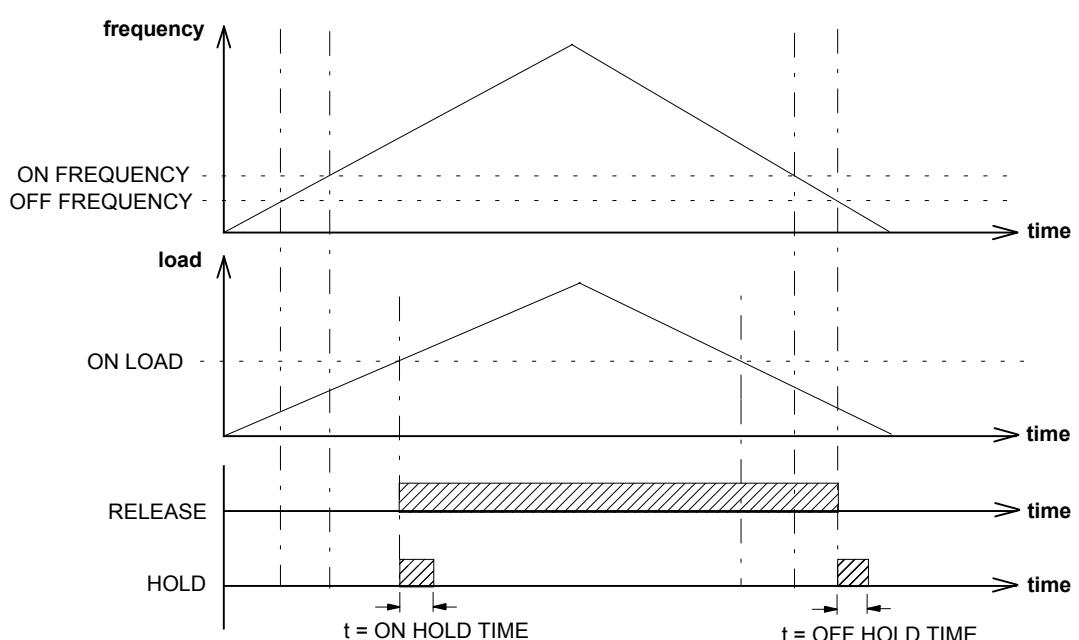

Boolean output providing a signal to operate the brake delay. Note RELEASE is forced FALSE if the drive is not in Run mode, or if Autotune, Flycatching or Injection Braking are active.

HOLD

Range: FALSE / TRUE

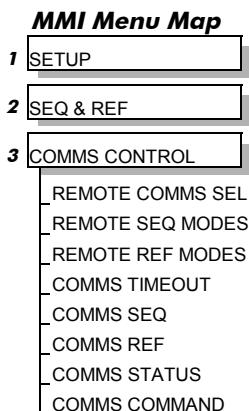

Becomes TRUE when the brake is toggled On or Off by the function block, and remains TRUE for the duration set by OFF HOLD TIME or ON HOLD TIME.

Functional Description

1-18 Programming Your Application

COMMS CONTROL

This block switches between Remote Terminal and Remote Comms operating modes.

The Inverter must be in Remote mode for selection to be made - REMOTE mode is enabled in the LOCAL CONTROL function block (REF MODES) and selected by the Operator Station. Refer to the outputs of the LOCAL CONTROL function block for the mode in use.

Comms Control	
COMMS SEQ	[295] FALSE
COMMS REF	[270] FALSE
COMMS STATUS	[272] 0
COMMS COMMAND	[273] 0
TERMINALS/COMMS	[300] REMOTE COMMS SEL
TERMINALS/COMMS	[307] REMOTE SEQ MODES
TERMINALS/COMMS	[308] REMOTE REF MODES
0.0 s	[309] COMMS TIMEOUT

Parameter Descriptions

REMOTE COMMS SEL

Range: FALSE / TRUE

Selects the type of remote communications mode:

- 0 : FALSE, and in REMOTE mode then control is from the terminals.
1 : TRUE, and in REMOTE mode then control is from the communications.

REMOTE SEQ MODES

Range: Enumerated - see below

Selects the type of remote sequencing mode:

Enumerated Value : Mode

- 0 : TERMINALS/COMMS
1 : TERMINALS ONLY
2 : COMMS ONLY

REMOTE REF MODES

Range: Enumerated - see below

Selects the type of remote reference mode:

Enumerated Value : Mode

- 0 : TERMINALS/COMMS
1 : TERMINALS ONLY
2 : COMMS ONLY

COMMS TIMEOUT

Range: 0.0 to 600.0 s

Sets the maximum time allowed between refreshing the COMMS COMMAND parameter. The drive will trip if this time is exceeded. Set the time to 0.00 seconds to disable this feature.

COMMS SEQ

Range: FALSE / TRUE

Diagnostic indicating if operating in Remote Sequencing Comms Mode.

If FALSE (0), the Inverter may be in Local Sequencing mode or Remote Sequencing Terminal mode.

COMMS REF

Range: FALSE / TRUE

Diagnostic indicating if operating in Remote Reference Comms Mode.

If FALSE (0), the Inverter may be in Local Reference mode or Remote Reference Terminal mode.

COMMS STATUS

Range: 0000 to FFFF

Diagnostic showing the 16-bit Status word as seen by the communications.

Refer to Chapter 4: "Sequencing Logic".

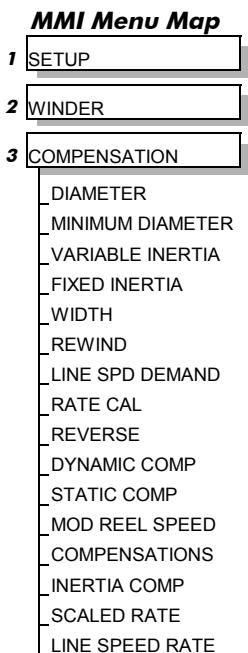

COMMS COMMAND

Range: 0000 to FFFF

Diagnostic showing the 16-bit Command as written by the communications.

Refer to Chapter 4: "Sequencing Logic".

COMPENSATION

This function block calculates the torque required to accelerate the mechanical inertia.

This block is used in Macro 4.

Compensation		
-	COMPENSATIONS [817]	0.00 %
-	INERTIA COMP [818]	0.00 %
-	SCALED RATE [819]	0.00 %
-	LINE SPEED RATE [820]	0.00 %
10.00 %	[805] DIAMETER	
10.00 %	[806] MINIMUM DIAMETER	
0.00 %	[807] VARIABLE INERTIA	
0.00 %	[808] FIXED INERTIA	
100.00 %	[809] WIDTH	
TRUE	[810] REWIND	
0.00 %	[811] LINE SPD DEMAND	
10.00	[812] RATE CAL	
FALSE	[813] REVERSE	
0.00 %	[814] DYNAMIC COMP	
0.00 %	[815] STATIC COMP	
0.00 %	[816] MOD REEL SPEED	

Parameter Descriptions

DIAMETER

Range: 0.00 to 100.00 %

Calculated diameter from diameter calculator.

MINIMUM DIAMETER

Range: 0.00 to 100.00 %

Min Diameter from diameter calculator.

VARIABLE INERTIA

Range: 0.00 to 100.00 %

The Variable Inertia is the Inertia of reel.

FIXED INERTIA

Range: 0.00 to 100.00 %

This is the inertia of the motor, gearbox and core.

WIDTH

Range: 0.00 to 100.00 %

The width input sets the web width and scales the variable inertia.

REWIND

Range: FALSE / TRUE

Selects between unwind and re-wind. Selected to REWIND when TRUE.

LINE SPD DEMAND

Range: -100.00 to 100.00 %

Line Speed demand is differentiated to calculate the rate of change of speed for inertia compensation.

RATE CAL

Range: -300.00 to 300.00

Scales differentiated LINE SPD DEMAND

REVERSE

Range: FALSE / TRUE

Sets the direction of the line speed.

DYNAMIC COMP

Range: 0.00 to 300.00 %

The compensation required to drive the winder at full speed.

STATIC COMP

Range: 0.00 to 300.00 %

The compensation required to drive the winder at minimum speed (zero)

MOD REEL SPEED

Range: 0.00 to 300.00 %

Reel speed feedback.

COMPENSATIONS

Range: —.00 %

Total open loop torque compensation.

1-20 Programming Your Application

INERTIA COMP

Range: —.00 %

Unscaled inertia compensation diagnostic.

SCALED RATE

Range: —.00 %

Scaled rate diagnostic.

LINE SPEED RATE

Range: —.00 %

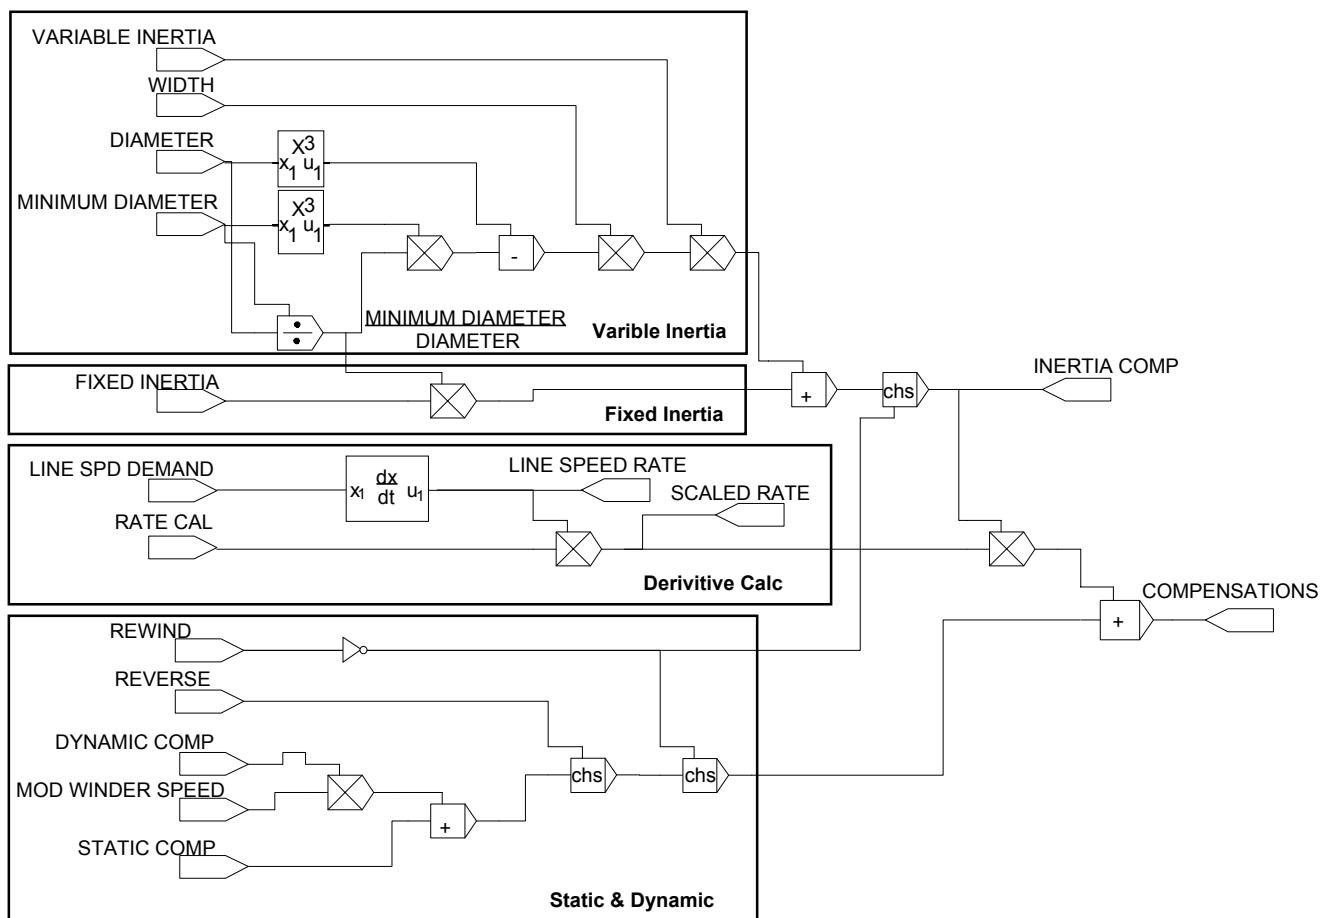

Differential of line speed.

Functional Description

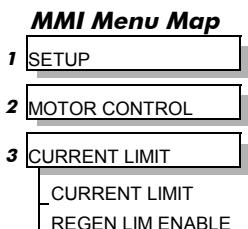

The FIXED INERTIA is the inertia of the motor, gearbox and core. The VARIABLE INERTIA is the inertia of the roll. A WIDTH input is available for setting the web width.

The total inertia (INERTIA COMP) is multiplied by the scaled acceleration rate to produce the torque demand. The polarity is set by the unwind/re-wind selection.

Accelerating a rewind requires additional torque in the same direction as the tension producing torque, whereas an unwind will require accelerating torque in the opposite direction to the tension torque. The acceleration rate comes from the line speed demand input. The line speed demand input is differentiated to produce a rate.

CURRENT LIMIT

Designed for all Motor Control Modes.

This function block allows you to set the maximum level of motor rated current (as a % of the user-set MOTOR CURRENT)

which is allowed to flow before current limit action occurs. If the measured motor current exceeds the current limit value with a motoring load, the motor speed is reduced to shed the excess load. If the measured motor current exceeds the current limit value with a regenerating load, the motor speed is increased up to a maximum of MAX SPEED (SETPOINT SCALE function block).

Current Limit	
150.00 %	- [365] CURRENT LIMIT
TRUE	- [686] REGEN LIM ENABLE

Note: The maximum value of current limit for a particular motor is limited by the 690+ current rating. If a motor of larger rating than the 690+ is connected, then the current limit applies to the 690+ and not the motor. In this case, the maximum value of the CURRENT LIMIT parameter is 150.00%.

Parameter Descriptions

CURRENT LIMIT

Range: 0.00 to 300.00 %

This parameter sets the level of motor current, as a % of MOTOR CURRENT (refer to the MOTOR DATA function block) at which the Inverter begins to take current limit action.

Refer also to “Quadratic/Constant Torque Selection”, page 1-136.

REGEN LIM ENABLE

Range: FALSE / TRUE

This parameter enables or disables regenerative current limit action.

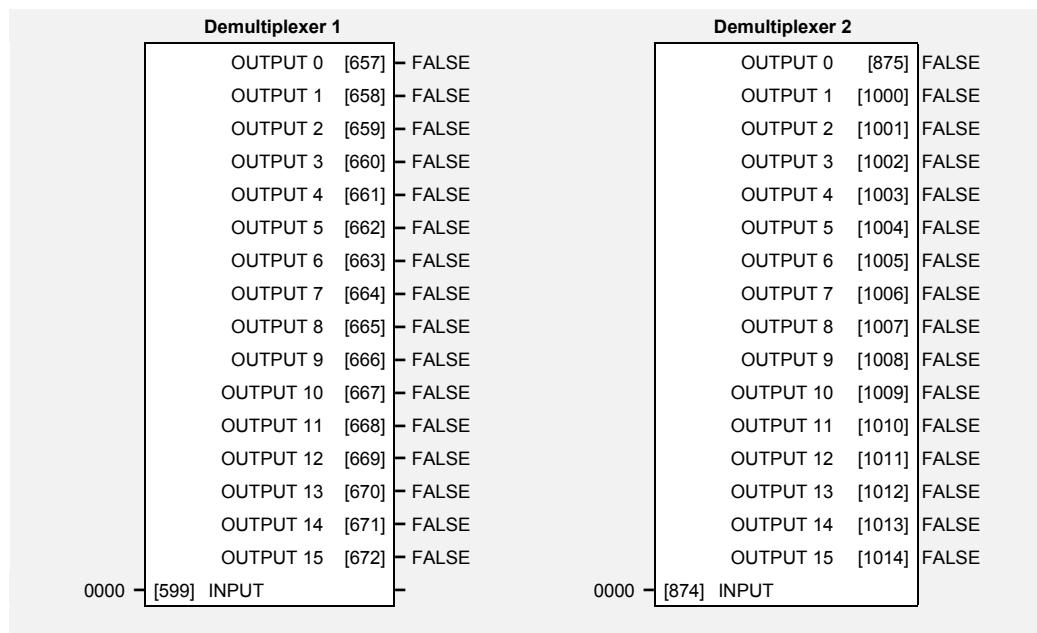

Note that this parameter only works in open-loop VOLTS / Hz motor control mode.

 - LINE SPEED
 - MINIMUM DIAMETER
 - MINIMUM SPEED
 - REEL SPEED
 - CURRENT CORE
 - DIAMETER
 - MOD LINE SPEED
 - MOD REEL SPEED

This block calculates reel diameter by dividing line speed by winder speed for centre wind applications.

The line and winder speeds are forced to be of positive sign, independent of the input speed sign. This ensures that the calculated diameter is always positive.

The line speed input should be the actual web speed from the previous section motor speed (the next section in the case of an unwind).

The winder speed is the spindle motor speed.

Refer to Macro 4.

Diameter Calc

0.00 %	[833]	REEL SPEED

Parameter Descriptions

DIAMETER HOLD

Range: FALSE / TRUE

Freezes the output of the filter when TRUE.

PRESET ENABLE

Range: FALSE / TRUE

Presets the filter to core or external diameter. Enabled when TRUE.

SELECT CORE 2

Range: FALSE / TRUE

Selects between CORE 1 and CORE2 for use when PRESET ENABLE is TRUE.
CORE 1 is selected when FALSE. CORE 2 is selected when TRUE.

SEL EXT DIAMETER

Range: FALSE / TRUE

Selects external diameter input for PRESET ENABLE when TRUE.

TENSION ENABLE

Range: FALSE / TRUE

Enables Tension Control.

CORE 1

Range: 0.00 to 120.00 %

Core size as a percentage of the maximum diameter.

CORE 2

Range: 0.00 to 120.00 %

Alternative core size (as a percentage of the maximum diameter).

1-24 Programming Your Application

DIAMETER TC	<i>Range: 0.00 to 300.00 s</i>
Filter time constant for DIAMETER output.	
EXT DIAMETER	<i>Range: 0.00 to 120.00 %</i>
External diameter input.	
LINE SPEED	<i>Range: -110.00 to 110.00 %</i>
Line speed input.	
MINIMUM DIAMETER	<i>Range: 0.00 to 120.00 %</i>
Sets the smallest reel diameter (calculated diameter value at full (100%) line speed and full (100%) winder speed).	
MINIMUM SPEED	<i>Range: 0.00 to 110.00 %</i>
The threshold below which the diameter output is held.	
REEL SPEED	<i>Range: -110.00 to 110.00 %</i>
Reel speed feedback.	
CURRENT CORE	<i>Range: —.00 %</i>
Diagnostic indicating the currently selected core size.	
DIAMETER	<i>Range: —.00 %</i>
Diameter output.	
MOD LINE SPEED	<i>Range: —.00 %</i>
Modulus of line speed.	
MOD REEL SPEED	<i>Range: —.00 %</i>
Modulus of reel speed.	

Functional Description

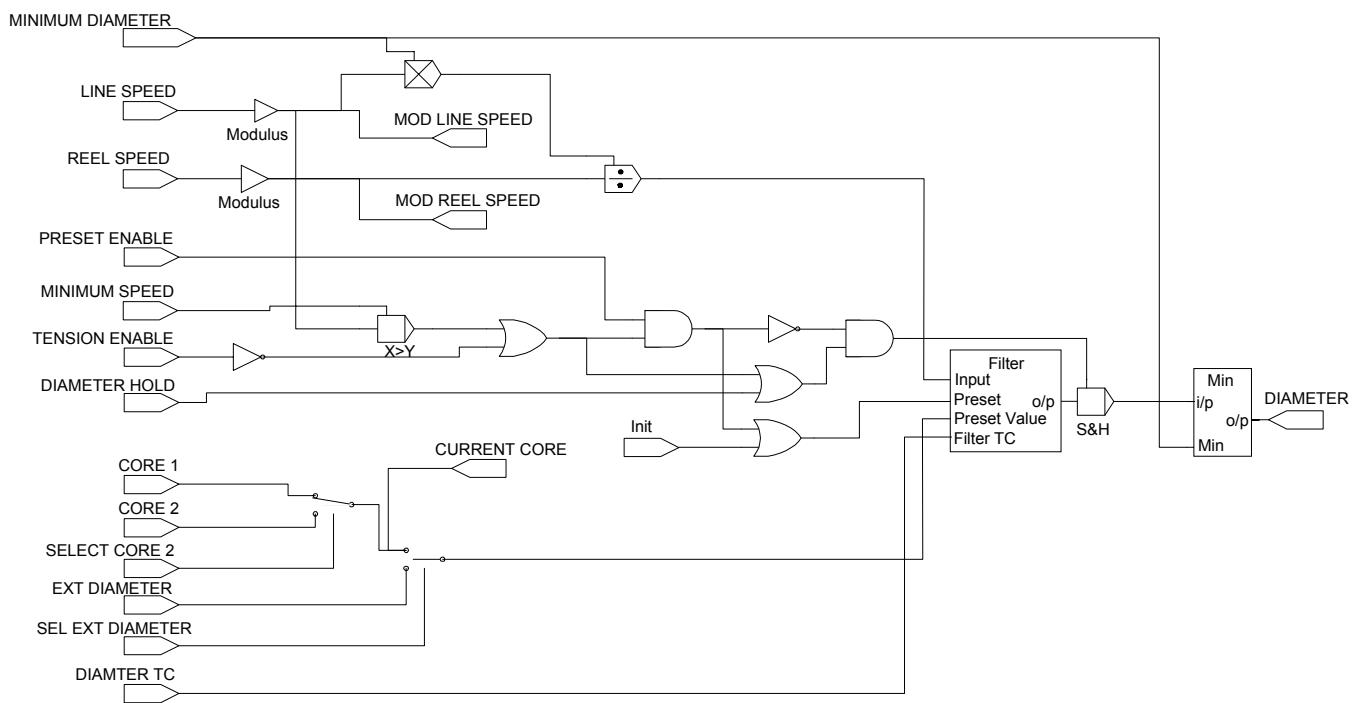

This function block performs the diameter calculation used by the other function blocks to enable the control of centre wind applications.

The diameter is calculated by dividing the absolute value of LINE SPEED by the absolute value of REEL SPEED. This result is scaled by the MINIMUM DIAMETER parameter. The filtered output tracks the diameter when TENSION ENABLE is True and LINE SPEED is above MINIMUM SPEED, otherwise the diameter is held at its current value.

When the diameter is held, a preset value is used as both the input and output of the filter. This is the value of CORE 1 or CORE 2, or the value of EXTERNAL DIAMETER.

The preset value is also loaded into the filter whenever the block diagram is restarted.

Note: *The diameter calculator will only operate with the web under some tension. The diameter filter prevents the diameter from changing quickly in the case of web break situations. The diameter output is clamped at the minimum diameter constant value.*

Parameter Descriptions

INVERT

Controls the optional inversion of the VALUE output.

Range: FALSE / TRUE

VALUE

The TRUE or FALSE input, (after any inversion).

Range: FALSE / TRUE

Functional Description

There is a DIGITAL INPUT function block associated with each of the following terminals:

The Control Board has seven configurable digital inputs:

DIGITAL INPUT 1 is associated with terminal 12
DIGITAL INPUT 2 is associated with terminal 13
DIGITAL INPUT 3 is associated with terminal 14
DIGITAL INPUT 4 is associated with terminal 15
DIGITAL INPUT 5 is associated with terminal 16
DIGITAL INPUT 6 is associated with terminal 17
DIGITAL INPUT 7 is associated with terminal 18

Note: Terminal 19 is permanently configured as the EXTERNAL TRIP input. Refer to I/O TRIPS, page 1-45.

DIGITAL INPUT 8 is associated with terminal 19

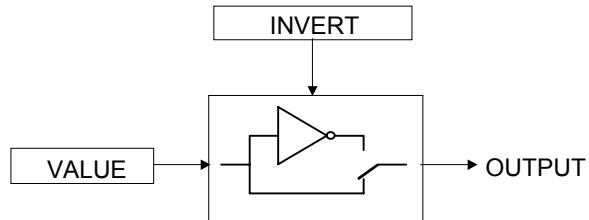

Programming Your Application 1-27

The System Board (optional) has 5 configurable digital inputs/outputs (DIGIO 1 to 5).

Each DIGIO can be configured to operate as either a Digital Input or a Digital Output.

Refer to DIGITAL OUTPUT, page 1-28.

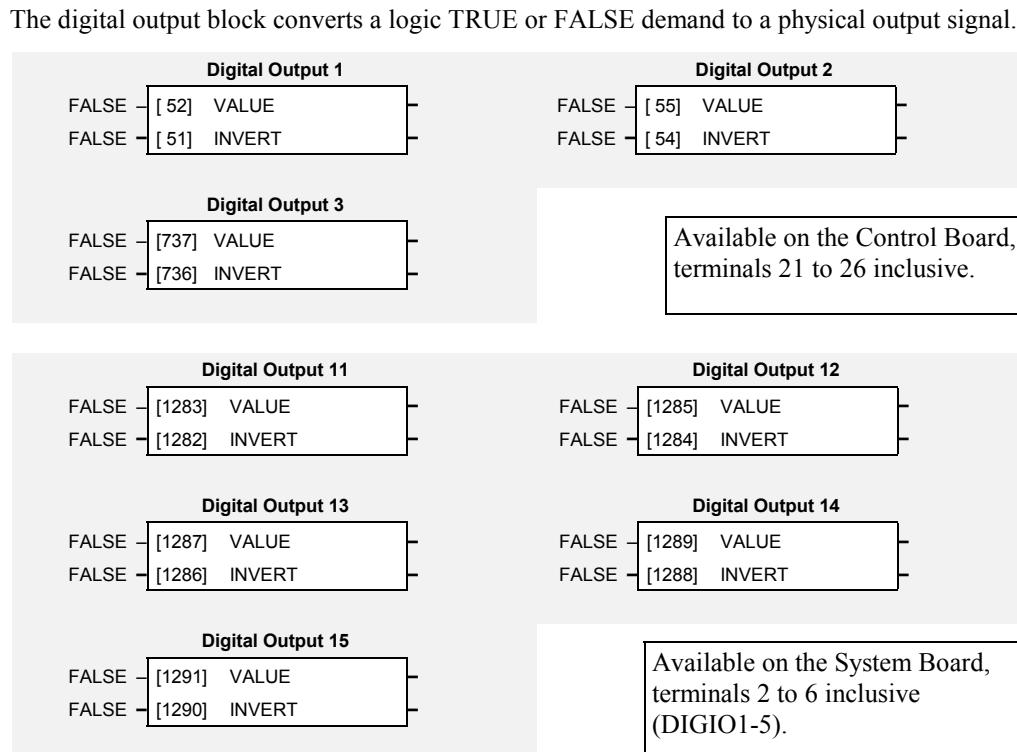

The input electronics of the Inverter converts the input signal to a TRUE or FALSE logic value. The digital input block takes this value and optionally inverts it before providing the VALUE output.

1-28 Programming Your Application

DIGITAL OUTPUT

MMI Menu Map

4	DIGITAL OUTPUT 12
4	DIGITAL OUTPUT 13
4	DIGITAL OUTPUT 14
4	DIGITAL OUTPUT 15
	VALUE
	INVERT

Parameter Descriptions

VALUE

The TRUE or FALSE output demand.

Range: FALSE / TRUE

INVERT

Controls the optional inversion of the VALUE output.

Range: FALSE / TRUE

Functional Description

There is a DIGITAL OUTPUT function block associated with each of the following terminals:

The Control Board has three digital outputs (volt-free relay contacts):

DIGITAL OUTPUT 1 is associated with terminals 21 & 22

DIGITAL OUTPUT 2 is associated with terminals 23 & 24

DIGITAL OUTPUT 3 is associated with terminals 25 & 26

The System Board (optional) has 5 configurable digital inputs/outputs (DIGIO 1 to 5):

DIGITAL OUTPUT 11 is associated with DIGIO1, terminal block A, terminal 2

DIGITAL OUTPUT 12 is associated with DIGIO2, terminal block A, terminal 3

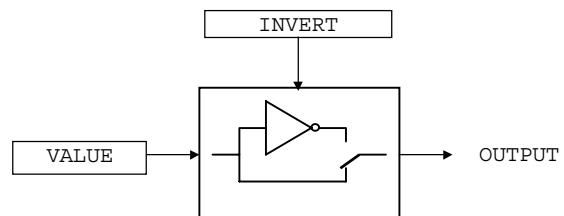

DIGITAL OUTPUT 13 is associated with DIGIO3, terminal block A, terminal 4

DIGITAL OUTPUT 14 is associated with DIGIO4, terminal block A, terminal 5

DIGITAL OUTPUT 15 is associated with DIGIO5, terminal block A, terminal 6

The default status for these 5 DIGIO is to act as inputs. Setting either VALUE or INVERT to TRUE will individually configure the block to be an output. Note that because INVERT reverses the output logic, setting both VALUE and INVERT to TRUE will configure the block to be an input.

Also refer to DIGITAL INPUT, page 1-26.

Parameter Descriptions

DECIMAL PLACE

Range: See below

Select the position of the decimal point.

Enumerated Value : Position

- 0 : DEFAULT
- 1 : X.XXXX
- 2 : X.XXX
- 3 : X.XX
- 4 : X.X
- 5 : X.

FORMULA

Range: See below

Select a formula where A, B and C are the coefficients listed below, and X is the value to modify.

Enumerated Value : Formula

- 0 : A/B * X + C
- 1 : A/B * (X+C)
- 2 : A/(B * X) + C
- 3 : A/(B * (X+C))

COEFFICIENT A

Range: -300.00 to 300.00

Coefficient used as defined by the formula.

COEFFICIENT B

Range: -300.00 to 300.00

Coefficient used as defined by the formula.

COEFFICIENT C

Range: -300.00 to 300.00

Coefficient used as defined by the formula.

HIGH LIMIT

Range: -300.00 to 300.00

Use high limit to set a maximum value for the modified parameter on the keypad. Setting the HIGH LIMIT lower than or equal to the LOW LIMIT makes the parameter “read-only”.

LOW LIMIT

Range: -300.00 to 300.00

Use low limit to set a minimum value for the modified parameter on the keypad. Setting the HIGH LIMIT higher than or equal to the HIGH LIMIT makes the parameter “read-only”.

UNITS

Range: max length is 6 chars

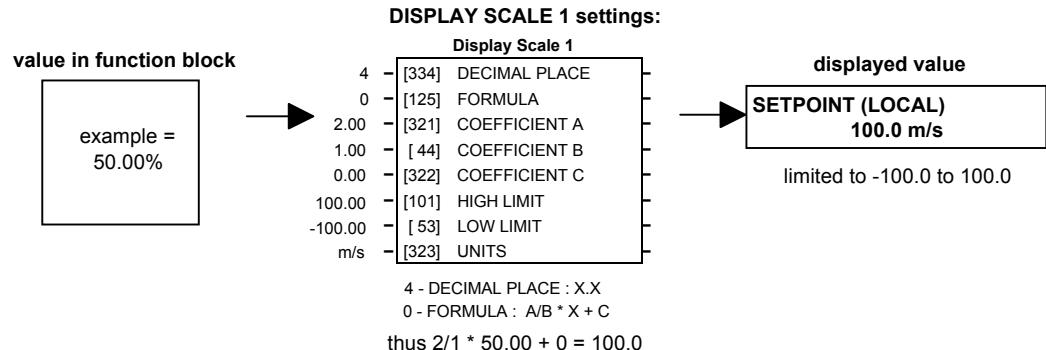

A 6 character label that is displayed as the parameter units.

1-30 Programming Your Application

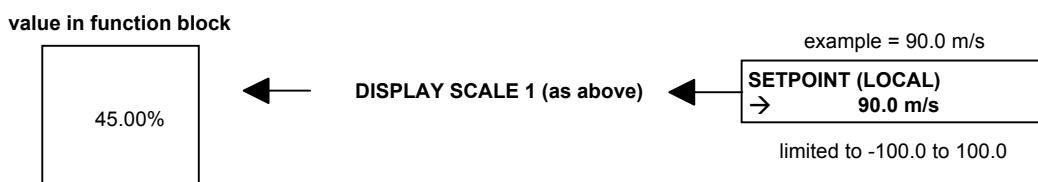

Functional Description

The DISPLAY SCALE blocks are selected in the ACCESS CONTROL and OPERATOR MENU function blocks for use with the Speed Setpoint and Operator Menu respectively.

For display purposes, the parameter is modified according to the formula chosen:

When adjusting parameters, the inverse of the formula is applied to the displayed value:

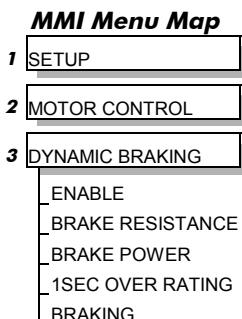

Character Sets

The table below lists the characters supported by the software in decimal and hexadecimal.

	HEX	DEC		HEX	DEC		HEX	DEC		HEX	DEC		HEX	DEC		HEX	DEC

DYNAMIC BRAKING

Designed for all Motor Control Modes.

The dynamic braking function block controls the rate at which energy from a regenerating motor is dumped into a resistive load. This dumping prevents the dc link voltage reaching levels which would cause an Overvoltage trip.

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

Enables operation of the dynamic braking block.

BRAKE RESISTANCE

Range: 1 to 1000 Ohm

The value of the load resistance.

BRAKE POWER

Range: 0.1 to 510.0 kW

The power that the load resistance may continually dissipate.

1SEC OVER RATING

Range: 1 to 40

Multiplier that may be applied to BRAKE POWER for power overloads lasting no more than 1 second.

BRAKING

Range: FALSE / TRUE

A read-only parameter indicating the state of the brake switch.

Functional Description

When enabled, the DYNAMIC BRAKING block monitors the internal dc link voltage every milli-second and sets the state of the brake switch accordingly.

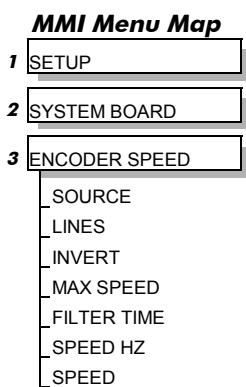

The dynamic braking block provides a control signal that is used by the SLEW RATE LIMIT block. This causes the setpoint to be temporarily frozen whenever the dynamic brake is operating because the dc link voltage exceeds the internal comparison level. This allows the stop rate to be automatically tuned to the characteristics of the load, motor, Inverter and brake resistor.

The DYNAMIC BRAKING block operates even when the motor output is not enabled. This allows the block to continually monitor the energy dumped into the braking resistor, and the energy dissipated across the brake switch. With this information the Inverter is able to deduce the loading on the brake resistor. Optional trips may be enabled should the switch or resistor be loaded beyond its capabilities.

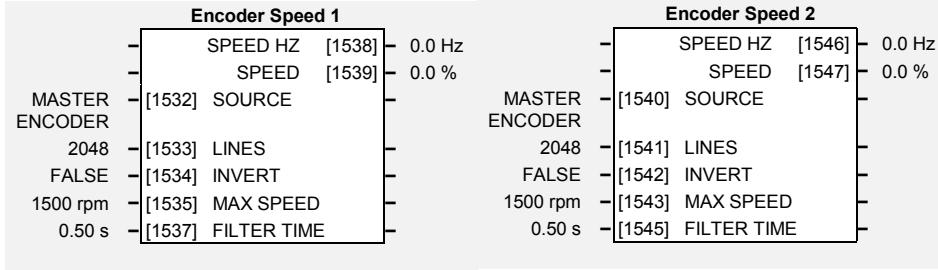

Refer also to the Installation Product Manual, Chapter 10: "Application Notes" - Dynamic Braking.

1-32 Programming Your Application

ENCODER SPEED

Designed for use with the System Board option, all Motor Control Modes.

This block allows Speed Feedback to be measured using a quadrature encoder when the System Board option is fitted.

Parameter Descriptions

SOURCE

Range: See below

Determines the encoder channel from which the speed is calculated.

Enumerated Value : Source

0 : MASTER ENCODER
1 : SLAVE ENCODER

LINES

Range: 1 to 32767

The number of lines must be set to match the type of encoder being used. Incorrect setting of this parameter will result in an erroneous speed measurement.

INVERT

Range: FALSE/TRUE

When TRUE, changes the sign of the measured speed and the direction of the position count.

MAX SPEED

Range: 0 to 32000 rpm

Sets the 100 % value in RPM. Refer to SPEED below.

FILTER TIME

Range: 0.00 to 300.00 s

Filter time constant for SPEED HZ and SPEED % outputs. Setting to zero will remove the filter.

SPEED Hz

Range: —. Hz

Speed Feedback in Hertz (revolutions per second).

SPEED

Range: —.x %

$$\text{SPEED \%} = \frac{\text{SPEED Hz} \times 60}{\text{MAX SPEED}} \times 100$$

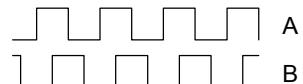

Functional Description

A quadrature encoder uses 2 input signals (A and B), phase shifted by a quarter of a cycle (90°). Direction is obtained by looking at the combined state of A and B.

Speed is calculated using the following function:

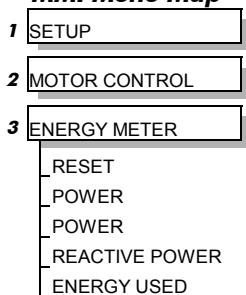

$$\text{SPEED HZ} = \text{filter} \left[\frac{\text{CountsPerSecond}}{\text{Lines} \times 4}, \text{FilterTime} \right]$$

where counts per second are the number of edges received from the encoder. There are 4 counts per line.

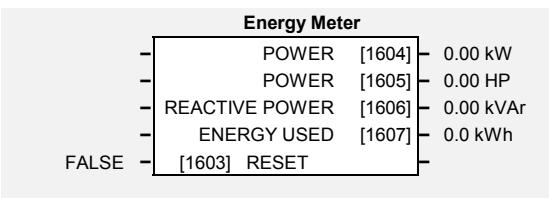

ENERGY METER

MMI Menu Map

This block measures the electrical energy used by the load.

Parameter Descriptions

RESET

Range: FALSE / TRUE

When RESET is set to TRUE, the ENERGY USED parameter is reset to zero automatically when the maximum value is reached.

When RESET is set to FALSE, the ENERGY USED parameter is held at the maximum value when the maximum value has been reached

Changing this from FALSE to TRUE at anytime will cause the ENERGY USED parameter to be reset to zero.

POWER

Range: -32768.00 to 32767.00 kW

This diagnostic shows the power being delivered to the load in kilowatts.

POWER

Range: -32768.00 to 32767.00 HP

This diagnostic shows the power being delivered to the load in horsepower.

REACTIVE POWER

Range: -32768.00 to 32767.00 kVAr

This diagnostic shows the reactive power being delivered to the load in kilovolt-amperes reactive.

ENERGY USED

Range: 0.00 to 32767.00 kWh

This diagnostic shows the total energy consumed by the load in kilowatt hours.

	MOTOR CURRENT &
	MOTOR CURRENT A

Designed for all Motor Control Modes.

The FEEDBACKS block allows you to view speed feedback and motor current related diagnostics. It also allows you to setup the encoder parameters, if one is fitted. These are ENCODER SUPPLY, ENCODER LINES, ENCODER INVERT and ENCODER MODE. An encoder requires the 6054 Speed Feedback Technology Option.

It also contains parameters for setting up the encoder used with the 6054 option.

Feedbacks	
DC LINK VOLTS	[75]
TERMINAL VOLTS	[1020]
SPEED FEEDBACK RPM	[569]
SPEED FBK REV/S	[568]
SPEED FEEDBACK %	[749]
ENCODER FBK %	[1238]
ENCODER COUNT	[1016]
TORQUE FEEDBACK	[70]
FIELD FEEDBACK	[73]
MOTOR CURRENT %	[66]
MOTOR CURRENT	[67]
** 10.0 V	[761] ENCODER SUPPLY
** 2048	[566] ENCODER LINES
**FALSE	[567] ENCODER INVERT
QUADRATURE	[565] ENCODER MODE
**FALSE	[50] QUADRATIC TORQUE

Parameter Descriptions

ENCODER SUPPLY

Range: 10.0 to 20.0V

Set this approximately to the supply voltage required by the Tech Box encoder, if supported.

ENCODER LINES

Range: 250 to 32767

The number of lines must be set to match the type of encoder being used. Incorrect setting of this parameter will result in an erroneous speed measurement.

ENCODER INVERT

Range: FALSE/TRUE

Used to match the encoder direction to the motor direction. When TRUE, it changes the sign of the measured speed and the direction of the position count.

It is necessary to set up this parameter when in CLOSED-LOOP VEC mode, as the encoder direction must be correct for this mode to operate.

ENCODER MODE

Range: Enumerated-see below

This parameter defines the type of encoder being used. If the System Board option is fitted, this parameter must be set to QUADRATURE.

Enumerated Value : Encoder Mode

- 0 : QUADRATURE
- 1 : CLOCK/DIR
- 2 : CLOCK

QUADRATIC TORQUE

Range: FALSE/TRUE

When TRUE, selects QUADRATIC allowing higher continuous ratings with less overload capability. Quadratic Torque operation is especially suited to fan or pump applications.

When FALSE, selects CONSTANT duty.

DC LINK VOLTS

Range: —. V

This shows the voltage on the dc link capacitors.

TERMINAL VOLTS

Range: —. V

This shows the rms voltage, between phases, applied by the inverter to the motor terminals. This should be 90% of MOTOR VOLTS at base speed if the motor is unloaded.

SPEED FEEDBACK RPM

Range: —.xx rpm

This parameter changes according to the CONTROL MODE (MOTOR DATA function block):

- In CLOSED-LOOP VEC mode the parameter shows the mechanical speed of the motor shaft in revolutions per minute as calculated from the Encoder Technology Box.
- In SENSORLESS VEC mode the parameter shows the calculated mechanical speed of the motor shaft in revolutions per minute.

SPEED FEEDBACK REV/S*Range: —.xx rev/s*

This parameter changes according to the CONTROL MODE (MOTOR DATA function block):

- In CLOSED-LOOP VEC mode the parameter shows the mechanical speed of the motor shaft in revolutions per second as calculated from the Encoder Technology Box.
- In SENSORLESS VEC mode the parameter shows the calculated mechanical speed of the motor shaft in revolutions per second.
- In VOLTS / Hz mode, the parameter shows the motor synchronous speed in revolutions per second.

SPEED FEEDBACK %*Range: —.xx %*

This parameter changes according to the CONTROL MODE (MOTOR DATA function block):

- In CLOSED-LOOP VEC mode the parameter shows the mechanical speed of the motor shaft as a percentage of the user maximum speed setting (MAX SPEED in the SETPOINT SCALE function block) as calculated from the Encoder Technology Box.
- In SENSORLESS VEC mode the parameter shows the calculated mechanical speed of the motor shaft as a percentage of the user maximum speed setting (MAX SPEED in the SETPOINT SCALE function block).
- In VOLTS / Hz mode, the parameter shows the electrical drive output frequency as a percentage of the user maximum speed setting (MAX SPEED in the SETPOINT SCALE function block).

ENCODER FBK %*Range: —.xx %*

This parameter shows the mechanical speed of the motor shaft, calculated from the Encoder Technology Box, as a percentage of the user maximum speed setting (MAX SPEED in the SETPOINT SCALE function block).

ENCODER COUNT*Range: —.*

In QUADRATURE MODE (see ENCODER MODE parameter) this increments/decrements @ 4 x line rate, i.e. 1 revolution = 4000 for a 1000 line encoder. In other modes it increments/decrements @ line rate, i.e. 1 revolution = 1000 for a 1000 line encoder.

This is a 16-bit register which is incremented or decremented by the pulses from the encoder. It is useful to check that the encoder is operating, and to measure the encoder lines, if this is not known. Rotate the motor shaft through 1 revolution and note the difference between readings at the start and finish.

In QUADRATURE MODE the difference should be 4 times the encoder lines, in other modes the difference should be equal to the encoder lines.

For greater accuracy, rotate the shaft through several revolutions.

The direction of count is unaffected by ENCODER INVERT.

TORQUE FEEDBACK*Range: —.xx %*

Shows the estimated motor torque, as a percentage of rated motor torque.

FIELD FEEDBACK*Range: —.xx %*

A value of 100% indicates the motor is operating at rated magnetic flux (field).

MOTOR CURRENT %*Range: —.xx %*

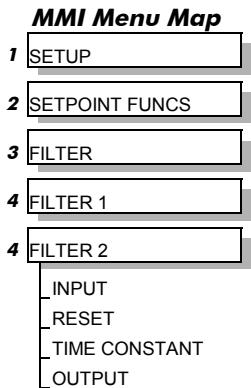

This diagnostic contains the level of rms line current being drawn from the Inverter and is seen as a % of the MOTOR CURRENT parameter setting in the MOTOR DATA function block.

MOTOR CURRENT*Range: —.xx A*

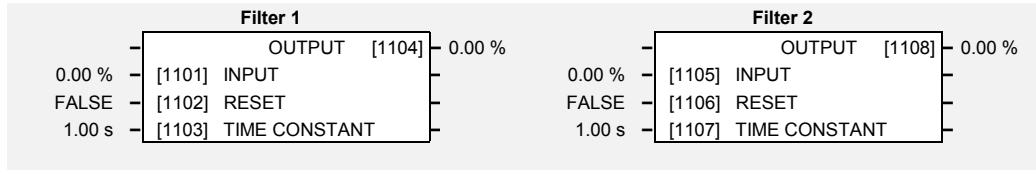

This diagnostic contains the level of rms line current being drawn from the Inverter.

1-36 Programming Your Application

FILTER

This function block contains two, simple order filters of the type: $\frac{1}{1 + ST}$

Parameter Descriptions

INPUT

Range: -300.00 to 300.00 %

Filter input.

RESET

Range: FALSE / TRUE

If TRUE, the output is set equal to the input and the filter is disabled.

TIME CONSTANT

Range: 0.00 to 300.00 s

Time constant. If less than 0.05s the filter is disabled.

OUTPUT

Range: —.00 %

Filtered output.

FLUXING

Designed for VOLTS/Hz motor Control Mode.

Parameter Descriptions

V/F SHAPE

Range: Enumerated - see below

This parameter determines the type of volts to frequency template is used to flux the motor. The choices of this parameter are:

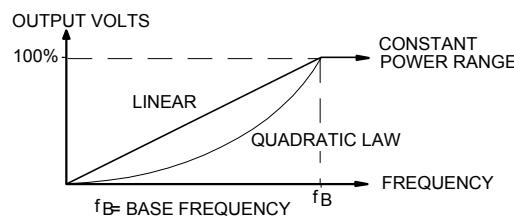

Enumerated Value : V/F Shape

- 0 : LINEAR LAW
- 1 : FAN LAW
- 2 : USER DEFINED

LINEAR LAW : This gives a constant flux characteristic up to the BASE FREQUENCY

FAN LAW: This gives a quadratic flux characteristic up to the BASE FREQUENCY. This matches the load requirement for fan and most pump applications

USER DEFINED : This gives a user defined flux characteristic up to the BASE FREQUENCY.

BASE FREQUENCY

Range: 7.5 to 1000.0 Hz

(See MOTOR DATA function block)

This parameter determines the frequency at which maximum output volts is generated. Below base frequency, the volts will vary with frequency as determined by the V/F SHAPE parameter. Above base frequency, the volts will saturate at the maximum value. Refer to MOTOR DATA (BASE FREQUENCY parameter), page 1-55.

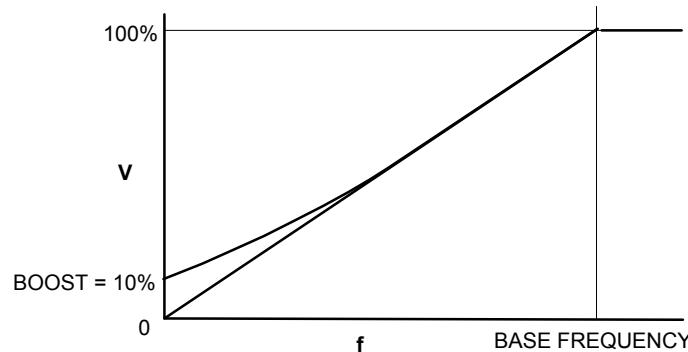

Refer to Chapter 2: "Parameter Specification" - Frequency Dependent Defaults

1-38 Programming Your Application

FIXED BOOST

Range: 0.00 to 25.00 %

This parameter allows for no-load stator resistance voltage drop compensation. This correctly fluxes the motor (under no-load conditions) at low output frequencies, thereby increasing available motor torque. Fixed boost can be set in addition to auto boost.

AUTO BOOST

Range: 0.00 to 25.00 %

This parameter allows for load dependent stator resistance voltage drop compensation. This correctly fluxes the motor (under load conditions) at low output frequencies, thereby increasing available motor torque. Auto boost can be set in addition to fixed boost.

The value of the AUTO BOOST parameter determines level of additional volts supplied to the motor for 100% load.

Setting the value of auto boost too high can cause the Inverter to enter current limit. If this occurs, the Inverter will be unable to ramp up in speed. Reducing the value of auto boost will eliminate this problem.

ACCELERTN BOOST

Range: 0.00 to 25.00 %

This parameter provides an additional amount of fixed boost when the drive is accelerating. This can help when starting heavy/high stiction loads.

ENERGY SAVING

Range: FALSE / TRUE

When set TRUE, the demanded volts are reduced to minimise energy consumption if the drive is operating in a steady state at light load.

USER FREQ 1 to 10

Range: 0.0 to 100.0 %

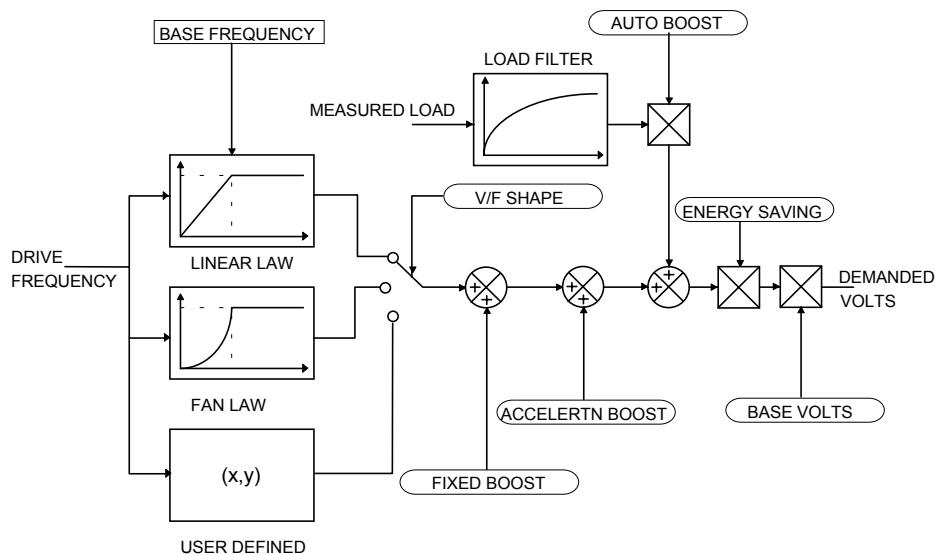

These parameters provide 10 frequency points, which together with the USER VOLTAGE parameters, provide the user defined voltage profile. (USER FREQ n, USER VOLTAGE n) provide up to 10 (x,y) points on this profile. The USER FREQ parameters are defined as a percentage of the BASE FREQUENCY parameter (refer to the MOTOR DATA function block).

USER VOLTAGE 1 to 10

Range: 0.0 to 100.0 %

These parameters provide 10 voltage points, which together with the USER FREQ parameters, provide the user defined voltage profile. (USER FREQ n, USER VOLTAGE n) provide up to 10 (x,y) points on this profile. The USER VOLTAGE parameters are defined as a percentage of the MOTOR VOLTAGE parameter (refer to the MOTOR DATA function block).

Functional Description

V/F Shape

The function block allows the user to parameterise the Inverter's conventional V/F motor fluxing scheme. Three V/F shapes are available, LINEAR LAW, FAN LAW and USER DEFINED:

- Linear Law V/F shape should be used in applications requiring constant motor torque though out the speed range (e.g. machine tools or hoists).
- Fan Law V/F shape provides extra energy savings for fan or pump applications.
- User Defined V/F shape provides a method for the user to define any profile. 10 user defineable (x,y) points are provided. Liner interpolation is used between each point. The drive also assumes the following points - (0%,0%) and (100%,100%) - though these may be overridden. For example, (USER FREQ 1 = 0%, USER VOLTAGE 1 = 5%) takes precedence over (0%, 0%).

For any of these V/F shapes the **BASE FREQUENCY** parameter (in the MOTOR DATA function block) which is the value of Inverter output frequency at which maximum output volts is provided, can be set by the user.

Boost Parameters

- Correct no-load motor fluxing at low Inverter output frequencies can be achieved by setting the **FIXED BOOST** parameter.
- Correct motor fluxing under load conditions is achieved by setting the **AUTO BOOST** parameter. The motor is correctly fluxed when the FIELD FBK diagnostic in the FEEDBACKS function block reads 100.0% .
- Additional **FIXED BOOST** can be applied during acceleration by setting the **ACCELERTN BOOST** parameter. This can be uesful for starting heavy/high stiction loads.

Saving Energy

An ENERGY SAVING mode is provided which, when enables under low load conditions in the steady state, attempts to reduce the output voltage so that minimum energy is used.

1-40 Programming Your Application

FLYCATCHING

MMI Menu Map

1	SETUP
2	MOTOR CONTROL

	VECTOR ENABLE
	START MODE
	SEARCH MODE
	SEARCH VOLTS
	SEARCH BOOST
	SEARCH TIME
	MIN SEARCH SPEED
	REFLUX TIME
	ACTIVE
	SETPOINT

Designed for all Motor Control Modes.

This block performs a directional speed search. It allows the Inverter to seamlessly catch a spinning motor before controlling the motor to the desired setpoint.

This is especially useful for large inertia fan loads, where drafts in building air ducts can cause a fan to 'windmill'.

Flycatching		
FALSE	ACTIVE [576]	FALSE
TRUE	SETPOINT [28]	0.00 %
ALWAYS	VHZ ENABLE [570]	
BIDIRECTIONAL	VECTOR ENABLE [1553]	
** 9.00 %	START MODE [571]	
** 40.00 %	SEARCH MODE [572]	
** 10.0 s	SEARCH VOLTS [573]	
5.0 Hz	SEARCH BOOST [32]	
** 3.0 s	SEARCH TIME [574]	
	MIN SEARCH SPEED [575]	
	REFLUX TIME [709]	

Parameter Descriptions

VHZ ENABLE

Range: FALSE / TRUE

Enables flycatching in Volts/Hz Control mode when TRUE.

VECTOR ENABLE

Range: FALSE / TRUE

Enables flycatching in Vector Control mode when TRUE.

START MODE

Range: Enumerated - see below

The mode of operation for the flycatching sequence software.

Enumerated Value : Start Mode

- 0 : ALWAYS
- 1 : TRIP OR POWERUP
- 2 : TRIP

SEARCH MODE

Range: Enumerated - see below

The type of speed search carried out by the flycatching sequence.

Enumerated Value : Search Mode

- 0 : BIDIRECTIONAL
- 1 : UNIDIRECTIONAL

SEARCH VOLTS

Range: 0.00 to 100.00 %

The percentage level of the search volts applied to the motor during the speed search phase of the flycatching sequence. Increasing this parameter improves the accuracy of the discovered motor speed but increases the braking influence of the speed search on the rotating motor.

SEARCH BOOST

Range: 0.00 to 50.00 %

The level of search boost applied to the motor during the speed search phase of the flycatching sequence.

SEARCH TIME

Range: 0.1 to 60.0 s

The search rate during the speed search phase of the flycatching sequence. Performing the flycatching speed search too quickly can cause the drive to inaccurately identify the motor speed. Refluxing at an inaccurate motor speed can cause the drive to trip on overvoltage. If this occurs, increasing this parameter will reduce the risk of tripping.

MIN SEARCH SPEED

Range: 0.0 to 500.0 Hz

The lowest search speed before the speed search phase of the flycatching sequence is considered to have failed.

REFLUX TIME

Range: 0.1 to 20.0 s

The rate of rise of volts from the search level to the working level after a successful speed search. Refluxing the motor too quickly can cause the drive to trip on either overvoltage or overcurrent. In either case, increasing this parameter will reduce the risk of tripping.

ACTIVE*Range: FALSE / TRUE*

A diagnostic output indicating whether the flycatching sequence is active.

SETPOINT*Range xxx.xx %*

This diagnostic output is the setpoint caught at the end of a successful flycatching sequence.

Functional Description

The flycatching function enables the drive to be restarted smoothly into a spinning motor. It applies small search voltages to the motor whilst ramping the Inverter frequency from maximum speed to zero. When the motor load goes from motoring to regenerating, the speed search has succeeded and is terminated. If the search frequency falls below the minimum search speed, the speed search has failed and the Inverter will ramp to the speed setpoint from zero.

The flycatching sequence can be triggered by different starting conditions:

- ALWAYS: All starts (after controlled or uncontrolled stop, or after a power-up)
- TRIP or POWER-UP: After uncontrolled stop, i.e. trip or coast, or after a power-up
- TRIP: After uncontrolled stop, i.e. trip or coast

The type of speed sequence may be Bidirectional or Unidirectional:

Bidirectional

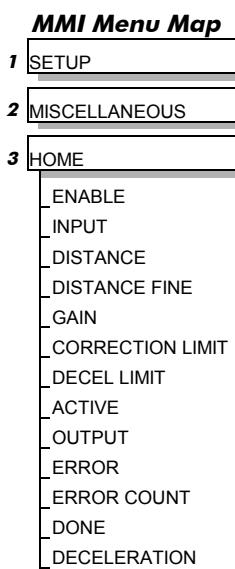

Initially, the search is performed in the direction of the speed setpoint. If the drive fails to identify the motor speed in this direction, a second speed search is performed in the reverse direction.

Unidirectional

The search is performed only in the direction of the speed setpoint.

1-42 Programming Your Application

HOME

This function block uses a position loop to stop the drive in a set distance.

The distance is set in revolutions based on the number of lines on the encoder, usually from a mark at a fixed distance from the home position.

For accurate positioning the drive must be in closed loop vector mode, if the drive is in any other mode then an open loop home algorithm will be used.

Home	
ACTIVE	[1469] FALSE
OUTPUT	[1472] 0.00 %
ERROR	[1471] FALSE
ERROR COUNT	[1467] 0
DONE	[1470] FALSE
DECCELERATION	[1468] 0.00 %
FALSE	- [1460] ENABLE
0.00 %	- [1461] INPUT
1.00	- [1462] DISTANCE
0.0000	- [1463] DISTANCE FINE
5.0	- [1464] GAIN
5.00 %	- [1465] CORRECTION LIMIT
100.0 %	- [1466] DECCEL LIMIT

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

ENABLE going from FALSE to TRUE latches the current position and time and initiates a position home operation. If set to FALSE then INPUT is passed straight through to OUTPUT. ENABLE must be held TRUE throughout the homing process, returning it to FALSE aborts the home function.

INPUT

Range: -300.00 to 300.00 %

The input to the block from REFERENCE :: SPEED DEMAND.

DISTANCE

Range: 0.00 to 300.00

Sets the homing distance in revolutions, a revolution calculated from the number of lines on the encoder and maximum speed (see MOTOR DATA for more information on these parameters).

DISTANCE FINE

Range: 0.0000 to 1.0000

Fine adjustment of homing distance. The actual homing distance is the sum of DISTANCE and DISTANCE FINE.

GAIN

Range: 0.0 to 1000.0

In closed loop homing, GAIN is used to stabilise the closed loop position trim signal. A value of zero disables closed loop homing.

CORRECTION LIMIT

Range: 0.00 to 100.00 %

Sets the maximum value of the closed loop position trim signal.

DECCEL LIMIT

Range: 0.0 to 3000.0 %

Sets the maximum allowable deceleration for closed loop homing. The actual required deceleration is calculated from the value of the input and homing distance when the block is enabled. If this is exceeded then the block will perform an open loop home with the calculated deceleration.

The HOME function block will only operate efficiently if the controller is operating within its capabilities i.e. not limiting.

If the Deceleration limit is exceeded then the ERROR output will be set.

ACTIVE

Range: FALSE / TRUE

Active is set TRUE whenever the block is enabled.

OUTPUT

Range: _xx

This is connected directly to INPUT if the block is not enabled. When enabled, OUTPUT is ramped to zero at a calculated rate to bring the motor to rest in a defined distance. OUTPUT is connected to SETPOINT SCALE :: INPUT, this will override the REFERENCE RAMP block.

Programming Your Application 1-43

ERROR

Range: FALSE / TRUE

Set TRUE if the maximum deceleration rate exceeded. Set FALSE if the block is not enabled.

ERROR COUNT

Range: _

This diagnostic is only valid in closed loop mode and shows the actual position error in encoder counts. It is this error that is used to correct for positional errors in the speed setpoint generation.

DONE

Range: FALSE / TRUE

Set TRUE when the position has been reached or the output is at zero in open loop operation.

DECELERATION

Range: _xx

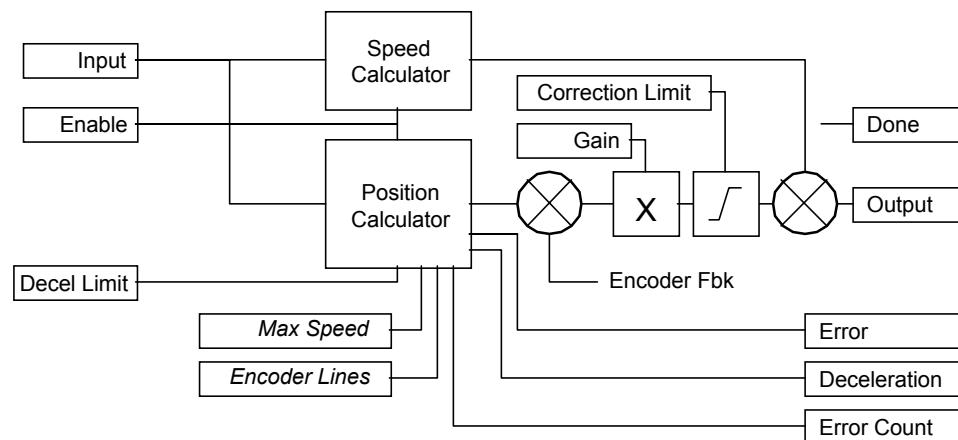

A diagnostic showing the actual deceleration used during the current / last home operation.

Functional Description

It is intended that homing be used to bring the motor to reset from a low speed (10%) over a relatively small distance (1 revolution). To achieve this the input should be connected to Reference :: Speed Demand and the output to Setpoint Scale :: Input, this will override the reference ramp.

Position Error is the distance in encoder pulses between the current position and Target position.

The homing distance is the stopping distance in encoder pulses.

Possible Causes of Homing Errors

Take the example of lift (elevator) with the following parameters

Motor:

100% Speed = 1500 RPM

5000 line encoder.

Gearbox 18:1 @ 2.5m/s)

Pulley 650mm diameter @ 2.5 m/s 1 revolution = 110 mm

How far does the car travel between the detection of the homing sensor and the drive seeing the ENABLE command?

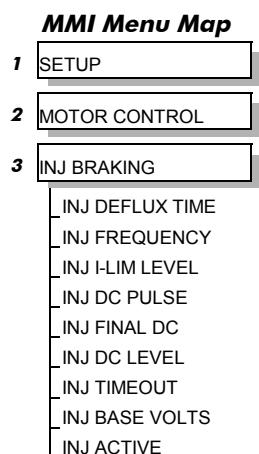

It will be assumed that the drive will be travelling relatively slowly when it receives the home command 1.5Hz = 0.75 RPM = 0.0825 mm / ms.

Typically the worst case levelling error will therefore be:

$$\begin{aligned}
 & 0.08 * (\text{cycle time of lift controller} + \text{cycle time of the vector drive}) \\
 & = 0.08 * (10+5) \\
 & = 1.2\text{mm}.
 \end{aligned}$$

1-44 Programming Your Application

INJ BRAKING

Designed for VOLTS/Hz Motor Control Mode.

The injection braking block provides a method of stopping spinning induction motors without returning the kinetic energy of the motor and load back in to the dc link of the Inverter. This is achieved by running the motor highly inefficiently so that all the energy stored in the load is dissipated in the motor. Thus, high inertia loads can be stopped without the need for an external dynamic braking resistor.

Inj Braking	
ACTIVE [583]	FALSE
** 0.5 s	[710] DEFLUX TIME
** 9.0 Hz	[577] FREQUENCY
100.00 %	[578] I-LIM LEVEL
** 2.0 s	[579] DC PULSE
** 1.0 s	[580] FINAL DC PULSE
** 4.00 %	[581] DC LEVEL
600.0 s	[582] TIMEOUT
** 100.00 %	[739] BASE VOLTS

Parameter Descriptions

DEFLUX TIME

Range: 0.1 to 20.0 s

Determines the time in which the Inverter defluxes the motor prior injection braking.

FREQUENCY

Range: 1.0 to 480.0 Hz

Determines the maximum frequency applied to the motor for the low frequency injection braking mode. It is also clamped internally so as never to exceed 50% of base speed value.

I-LIM LEVEL

Range: 50.00 to 150.00 %

Determines the level of motor current flowing during low frequency injection braking.

DC PULSE

Range: 0.0 to 100.0 s

Determines the duration of the dc pulse applied to the motor when injection braking is required for motor speeds below 20% of base speed. The actual dc pulse time applied to the motor is dependent on the ratio of initial motor speed to 20% of base speed.

FINAL DC PULSE

Range: 0.0 to 10.0 s

Determines the duration of the final dc holding pulse applied to the motor after either low frequency injection braking or timed dc pulse.

DC LEVEL

Range: 0.00 to 25.00 %

Determines the level of dc pulse applied to the motor during either the timed or final dc pulse.

TIMEOUT

Range: 0.0 to 600.0 s

Determines the maximum amount of time the sequence is allowed to remain in the low frequency injection braking state.

BASE VOLTS

Range: 0.00 to 115.47 %

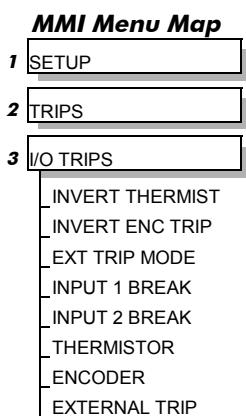

Determines the maximum volts at base speed applied to the motor during injection braking.

ACTIVE

Range: FALSE / TRUE

Indicates the state of the Inverter. TRUE when injection braking.

I/O TRIPS

This function block is designed to operate in conjunction with the Analog and Digital Input function blocks to trip the Inverter on a loss of setpoint input or safety control input.

I/O Trips		
	THERMISTOR [1155]	FALSE
	ENCODER [1156]	FALSE
	EXTERNAL TRIP [234]	FALSE
FALSE	[760] INVERT THERMIST	
FALSE	[1154] INVERT ENC TRIP	
TRIP	[233] EXT TRIP MODE	
FALSE	[235] INPUT 1 BREAK	
FALSE	[236] INPUT 2 BREAK	

Parameter Descriptions

INVERT THERMIST

Range: FALSE / TRUE

Inverts the sense of the motor thermistor input. The default FALSE is normally-closed/low impedance.

INVERT ENC TRIP

Range: FALSE / TRUE

Inverts the sense of the encoder fail input on the encoder Technology Box. FALSE for normally-closed.

EXT TRIP MODE

Range: TRIP / COAST

When set to TRIP, DIN8 (EXT TRIP) will trip the drive when +24V is not present, causing EXTERNAL TRIP to be displayed on the MMI.

When set to COAST the drive will not trip, but “coasts to stop” when +24V is not present.

INPUT 1 BREAK

Range: FALSE / TRUE

A general purpose signal designed to be internally wired to the function block ANALOG INPUT 1, BREAK parameter. When this signal goes TRUE this causes an INPUT 1 BREAK trip to occur, (unless this trip is disabled within the TRIPS STATUS function block, see the DISABLE TRIPS parameter).

This parameter is not saved in the Inverter’s non-volatile memory and thus is reset to the default setting at power-up.

INPUT 2 BREAK

Range: FALSE / TRUE

A general purpose signal designed to be internally wired to the function block ANALOG INPUT 2, BREAK parameter. When this signal goes TRUE this causes an INPUT 2 BREAK trip to occur, (unless this trip is disabled within the TRIPS STATUS function block, see the DISABLE TRIPS parameter).

This parameter is not saved in the Inverter’s non-volatile memory and thus is reset to the default setting at power-up.

THERMISTOR

Range: FALSE / TRUE

The current state of the motor thermistor trip input, modified by INVERT THERMIST input.

ENCODER

Range: FALSE / TRUE

The current state of the encoder Technology Box error trip input. TRUE is tripped.

EXTERNAL TRIP

Range: FALSE / TRUE

The current state of the External Trip input (terminal 19). Note that this input is inverted, so is TRUE if 0V is on the terminal.

Functional Description

The I/O TRIPS function block allows trips to be generated by signals on the input terminals of the Inverter. Refer to the Installation Product Manual, Chapter 6 for a description of the trips supported by the Inverter.

1-46 Programming Your Application

INVERSE TIME

MMI Menu Map

- 1 SETUP
- 2 MOTOR CONTROL
- 3 INVERSE TIME
 - AIMING POINT
 - DELAY
 - DOWN RATE
 - UP RATE
 - IT LIMITING
 - INVERSE TIME OP

Designed for all Motor Control Modes.

The purpose of the inverse time is to automatically reduce the inverter current limit in response to prolonged overload conditions. As the motor current exceeds the AIMING POINT level, the excess current is integrated. Motor current is allowed to flow at the CURRENT LIMIT (refer to the Current Limit function block) for a period defined by the DELAY parameter. At this point the inverse time current limit is ramped down from the CURRENT LIMIT. The rate at which the inverse time current limit is ramped to the AIMING POINT is defined by DOWN TIME.

Inverse Time	
IT LIMITING [1152]	FALSE
INVERSE TIME OP [1153]	0.00 %
105.00 %	[1148] AIMING POINT
60.0 s	[1149] DELAY
10.0 s	[1150] DOWN TIME
120.0 s	[1151] UP TIME

Once the overload condition is removed, the inverse time current limit level is ramped back toward the CURRENT LIMIT.

In Quadratic Torque mode, the allowed overload is reduced to 115.0 % for 60.0 s before inverse time current limit action occurs.

Parameter Descriptions

AIMING POINT

Range: 50.00 to 150.00%

Determines the final level of the inverse time current limit after a period of prolonged motor overload

DELAY

Range: 5.0 to 60.0s

Determines the maximum allowed overload duration for 150.0 % motor current (110.0% in QUADRATIC TORQUE mode) before inverse time current limit action is taken.

Refer also to “Quadratic/Constant Torque Selection”, page 1-136.

DOWN TIME

Range: 1.0 to 10.0s

Determines the rate at which the inverse time current limit is ramped to the AIMING POINT after a period of prolonged overload.

UP TIME

Range: 1.0 to 600.0s

Determines the rated at which the inverse time current limit is ramped back to the CURRENT LIMIT (refer to the Current limit function block) once the overload is removed.

IT LIMITING

Range: FALSE / TRUE

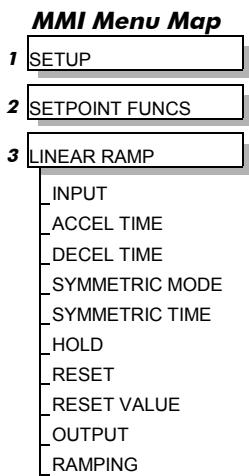

This diagnostic indicates if the inverse time current limit is active.

INVERSE TIME OP

Range: —.00 %

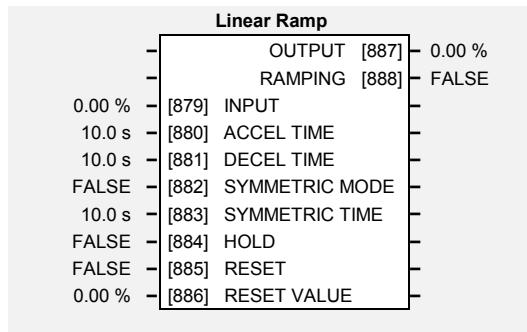

This diagnostic indicates the present level of the inverse time current limit.

LINEAR RAMP

This function block limits the rate of change of an input.

Refer to REFERENCE RAMP, page 1-91.

Parameter Descriptions

INPUT

Range: -300.00 to 300.00%

Ramp input.

ACCEL TIME

Range: 0.0 to 3000.0 s

The time that the Inverter will take to ramp the setpoint from 0.00% to 100.00%.

DECEL TIME

Range: 0.0 to 3000.0 s

The time that the Inverter will take to ramp the setpoint from 100.00% to 0.00%.

SYMMETRIC MODE

Range: FALSE / TRUE

Select whether to use the ACCEL TIME and DECEL TIME pair of ramp rates, or to use the SYMETRIC RATE parameter to define the ramp rate for the Inverter.

SYMMETRIC TIME

Range: 0.0 to 3000.0 s

The time that the inverter will take to ramp from 0.00% to 100.00% and from 100.00% to 0.00% when SYMMETRIC MODE is TRUE.

HOLD

Range FALSE / TRUE

When TRUE the output of the ramp is held at its last value.

RESET

Range: FALSE / TRUE

If TRUE, the output is made equal to the input.

RESET VALUE

Range: -300.00 to 300.00 %

The value that the output is set to while RESET is TRUE.

OUTPUT

Range: —.00 %

The ramp output.

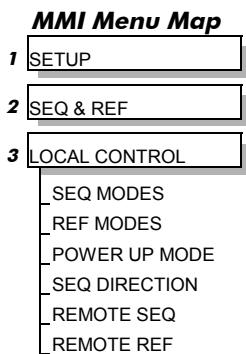

RAMPING

Range: FALSE / TRUE

This is set TRUE when ramping.

1-48 Programming Your Application

LOCAL CONTROL

This block allows the available modes of Local and Remote operation to be customised. It also indicates the selected mode.

You can only switch between Local and Remote modes using the Operator Station. Refer to the Installation Product Manual, Chapter 5: "The Operator Station" - The L/R Key.

Local Control	
LOCAL/REMOTE	REMOTE SEQ [297] TRUE
LOCAL/REMOTE	REMOTE REF [257] TRUE
[298]	SEQ MODES
[265]	REF MODES
REMOTE	[299] POWER UP MODE
FALSE	[281] SEQ DIRECTION

Parameter Descriptions

SEQ MODES

Range: Enumerated - see below

Allows the source of sequencing commands to be selected. Local is the Operator Station, Remote is an external signal. The modes supported are:

Enumerated Value : Seq Mode

- 0 : LOCAL/REMOTE
- 1 : LOCAL ONLY
- 2 : REMOTE ONLY

REF MODES

Range: Enumerated - see below

Allows the source of the reference signal to be selected. Local is the Operator Station, Remote is an external signal. The modes supported are:

Enumerated Value : Ref Mode

- 0 : LOCAL/REMOTE
- 1 : LOCAL ONLY
- 2 : REMOTE ONLY

POWER UP MODE

Range: Enumerated - see below

Allows the power-up operating mode of the Inverter to be selected. Local is the Operator Station, Remote is an external signal, Automatic is the same mode as at power-down. The modes supported are:

Enumerated Value : Power Up Mode

- 0 : LOCAL
- 1 : REMOTE
- 2 : AUTOMATIC

SEQ DIRECTION

Range: FALSE / TRUE

When TRUE, direction is a Sequencing command.

When FALSE, direction is a Reference command.

REMOTE SEQ

Range: FALSE / TRUE

This parameter indicates the present source of the sequencing commands.

REMOTE REF

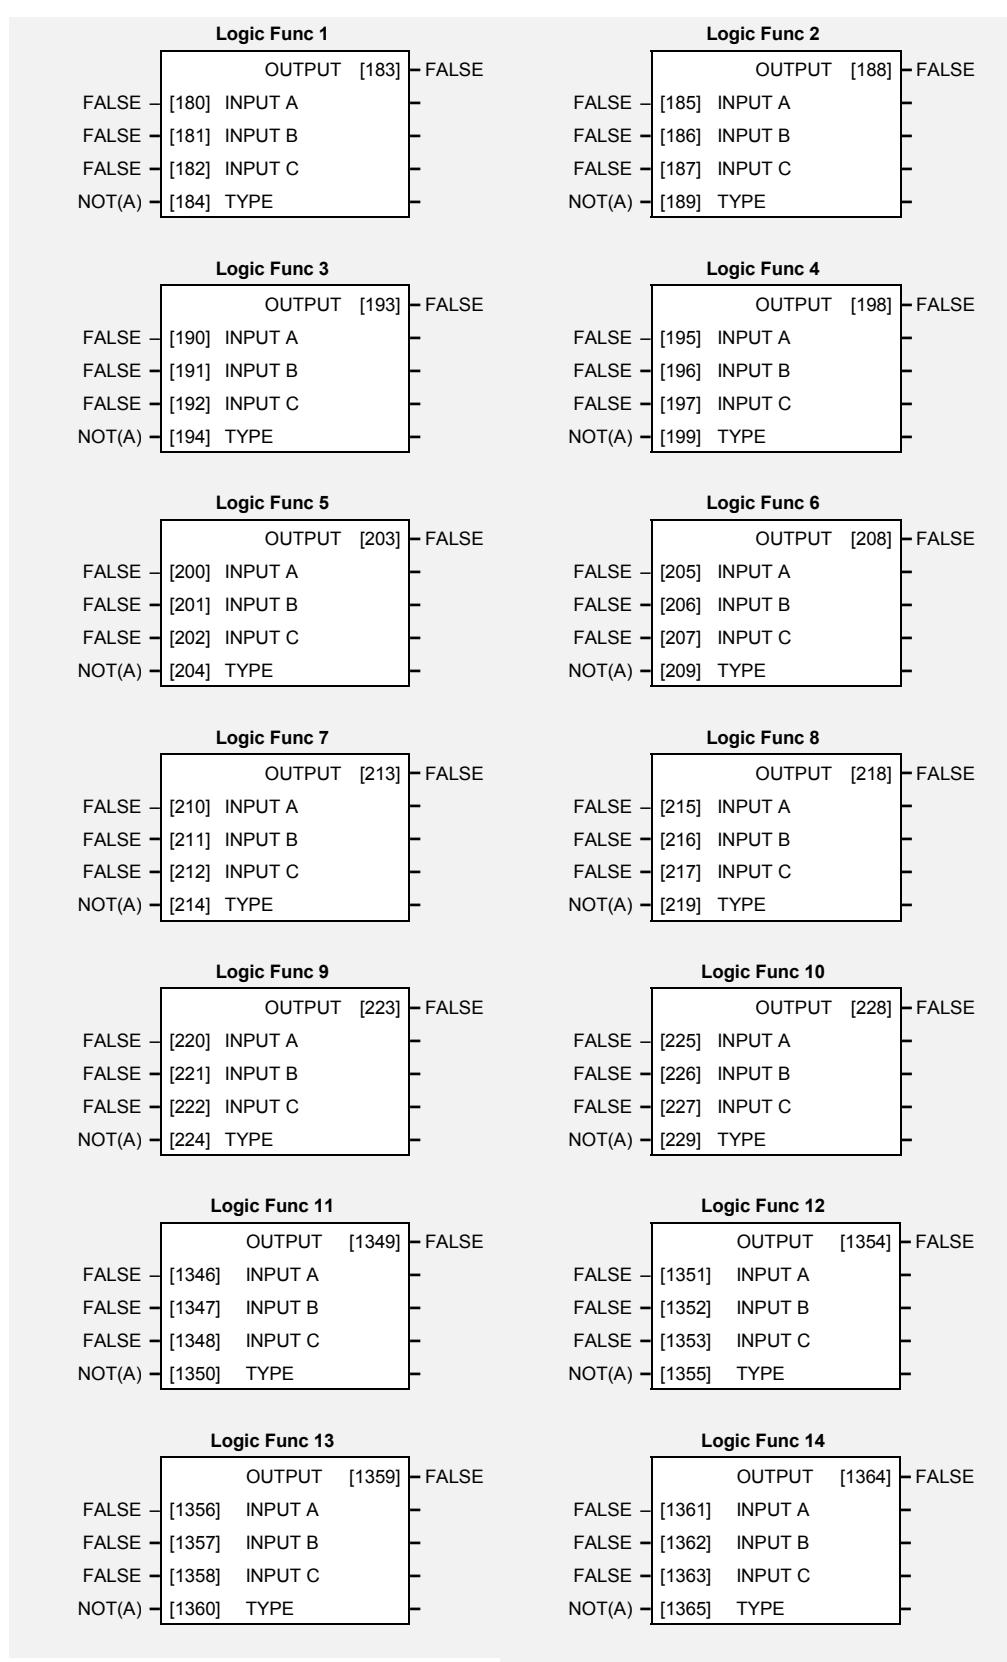

Range: FALSE / TRUE

This parameter indicates the present source of the reference signal.

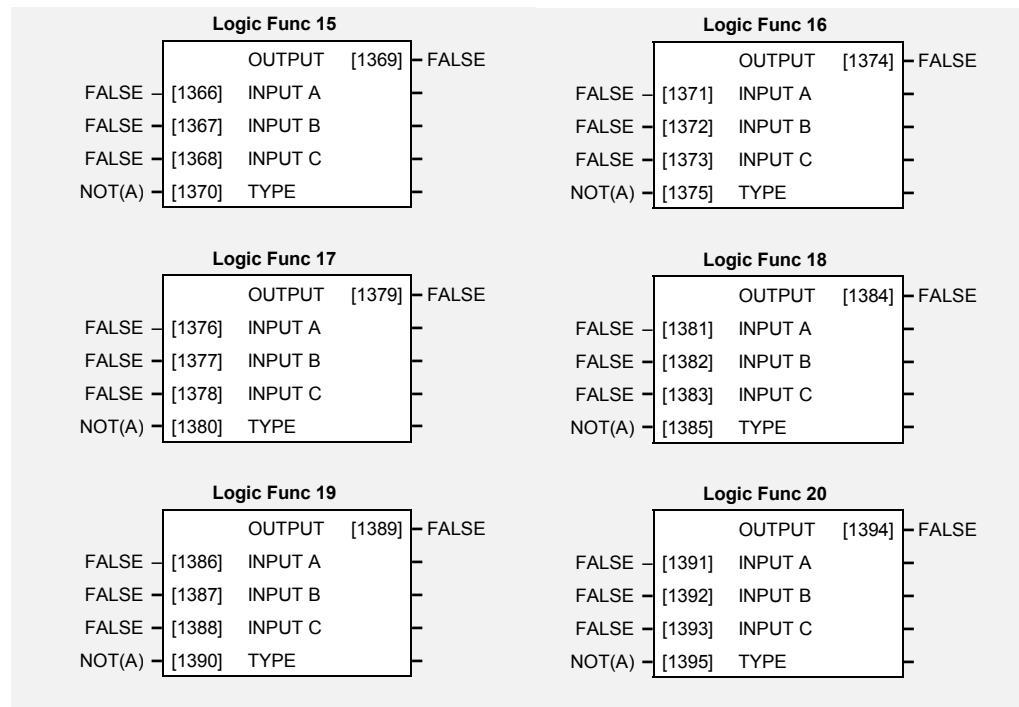

LOGIC FUNCTION

MMI Menu Map

- 4 LOGIC FUNC 8
- 4 LOGIC FUNC 9
- 4 LOGIC FUNC 10
 - INPUT A
 - INPUT B
 - INPUT C
 - TYPE
 - OUTPUT

1-50 Programming Your Application

Parameter Descriptions

INPUT A

Range: FALSE / TRUE

General purpose logic input.

INPUT B

Range: FALSE / TRUE

General purpose logic input.

INPUT C

Range: FALSE / TRUE

General purpose logic input.

TYPE

Range: Enumerated - see below

The operation to be performed on the three inputs to produce the output value. The operations that can be selected are:

Enumerated Value : Type

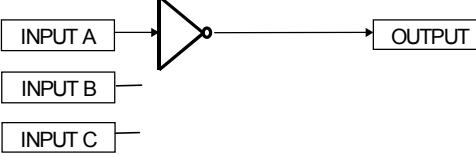

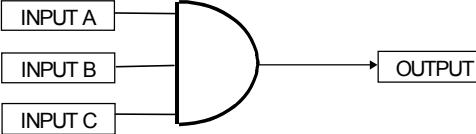

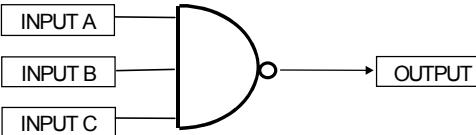

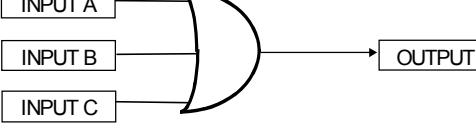

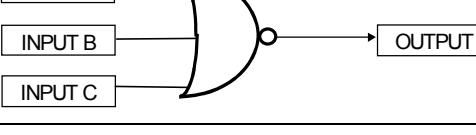

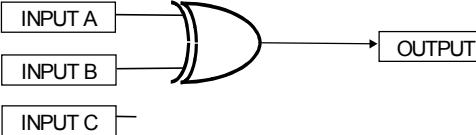

- 0 : NOT(A)
- 1 : AND(A,B,C)
- 2 : NAND(A,B,C)
- 3 : OR(A,B,C)
- 4 : NOR(A,B,C)
- 5 : XOR(A,B)
- 6 : 0-1 EDGE(A)
- 7 : 1-0 EDGE(A)
- 8 : AND(A,B,!C)
- 9 : OR(A,B,!C)
- 10 : S FLIP-FLOP
- 11 : R FLIP-FLOP

OUTPUT

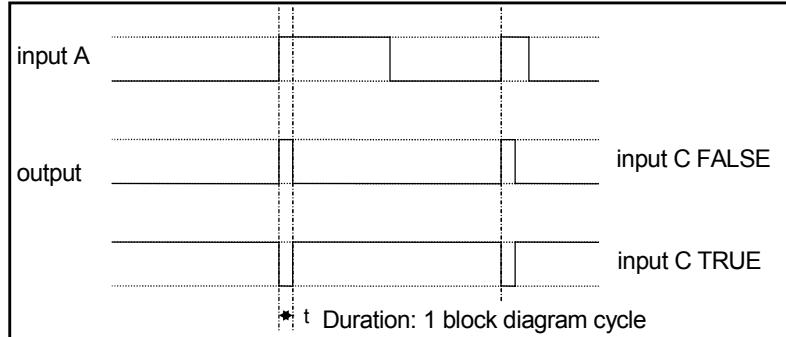

Range: FALSE / TRUE

The result of performing the selected operation on the inputs.

Functional Description

Operation	Description	
NOT(A)	NOT(A) 	If INPUT A is TRUE the OUTPUT is FALSE, otherwise the OUTPUT is TRUE.
AND(A,B,C)	AND(A,B,C) 	If A and B and C are all TRUE then the OUTPUT is TRUE, otherwise the OUTPUT is FALSE.
NAND(A,B,C)	NAND(A,B,C) 	If A and B and C are all TRUE then the OUTPUT is FALSE, otherwise the OUTPUT is TRUE.
OR(A,B,C)	OR(A,B,C) 	If at least one of A or B or C is TRUE then the OUTPUT is TRUE, otherwise the OUTPUT is FALSE.
NOR(A,B,C)	NOR(A,B,C) 	If at least one of A or B or C is TRUE then the OUTPUT is FALSE, otherwise the OUTPUT is TRUE.
XOR(A,B)	XOR(A,B) 	If A and B are the same, (both TRUE or both FALSE), then the output is FALSE, otherwise the output is TRUE.

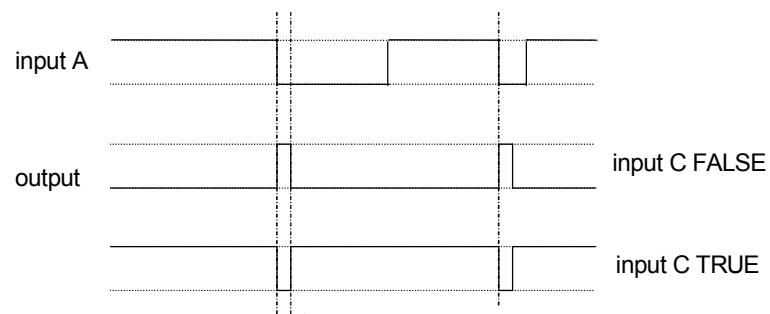

1-52 Programming Your Application

Operation	Description
0-1 EDGE(A)	 <p>input A</p> <p>output</p> <p>input C FALSE</p> <p>input C TRUE</p> <p>* t Duration: 1 block diagram cycle</p>

Rising Edge Trigger

Input B is not used.

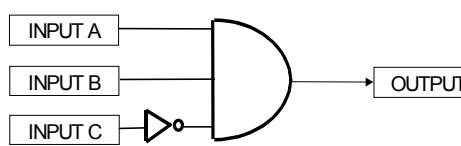

This function outputs a pulse of 5ms duration when INPUT A to the block becomes TRUE. When INPUT C is TRUE, the output is inverted. The output is held TRUE for one execution of the function block diagram.

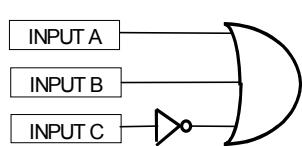

1-0 EDGE(A)	 <p>input A</p> <p>output</p> <p>input C FALSE</p> <p>input C TRUE</p> <p>* t Duration: 1 block diagram cycle</p>
-------------	--

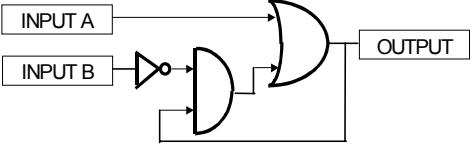

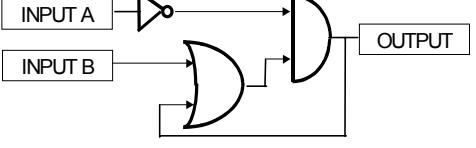

Falling Edge Trigger

Input B is not used.

This function outputs a pulse of 5ms duration when INPUT A to the block becomes FALSE. When INPUT C is TRUE, the output is inverted. The output is held TRUE for one execution of the function block diagram.

AND(A,B,!C)	AND(A,B,!C)	Input State
		A B C Output State
		0 0 0 0
		0 0 1 0
		0 1 0 0
		0 1 1 0
		1 0 0 0
		1 0 1 0
		1 1 0 1
		1 1 1 0
Refer to the Truth Table.		
FALSE = 0, TRUE = 1.		

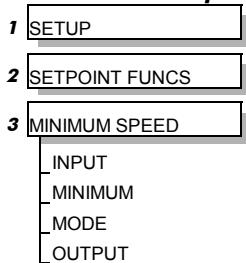

OR(A,B,!C)	OR(A,B,!C)	Input State
		A B C Output State
		0 0 0 1
		0 0 1 0
		0 1 0 1
		0 1 1 1
		1 0 0 1
		1 0 1 1
		1 1 0 1
		1 1 1 1
Refer to the Truth Table.		
FALSE = 0, TRUE = 1.		

Operation	Description
S FLIP-FLOP	S FLIP-FLOP  <p>This is a set dominant flip-flop. INPUT A functions as <i>set</i>, and INPUT B as <i>reset</i>.</p>
R FLIP-FLOP	R FLIP-FLOP  <p>This is a reset dominant flip-flop. INPUT A functions as <i>reset</i>, and INPUT B as <i>set</i>.</p>

1-54 Programming Your Application

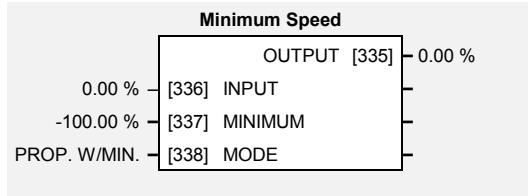

MINIMUM SPEED

MMI Menu Map

The minimum speed block is used to determine how the Inverter will follow a reference. There are two modes

1. Proportional : minimum limit
2. Linear : between min and max.

Parameter Descriptions

INPUT

The input for this block.

Range: -300.00 to 300.00 %

MINIMUM

This parameter determines the minimum output value from this block

Range: -100.00 to 100.00 %

MODE

Range: Enumerated - see below

This parameter represents the operating mode of the block. There are two modes:

Enumerated Value : Operating Mode

- 0 : PROP. W/MIN.
- 1 : LINEAR

OUTPUT

Range: —.xx %

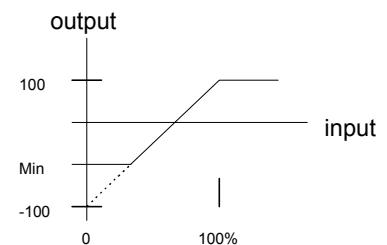

The output is determined by the MODE selected, see below.

Functional Description

There are two operating modes for the MINIMUM SPEED block:

Proportional with Minimum

In this mode the MINIMUM SPEED block behaves like a simple clamp. The minimum value has the valid range -100% to 100% and the output is always greater than or equal to the minimum value.

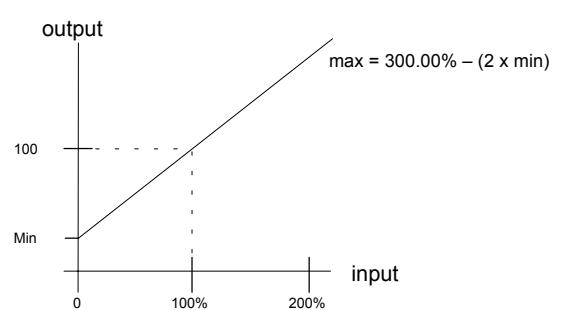

Linear

In this mode the MINIMUM SPEED block first clamps the input to zero then rescales the input such that the output goes linearly between minimum and 100% for an input that goes from 0 to 100%.

Note the constraints:-

$$\begin{aligned} \text{min} &\geq 0 \\ \text{input} &\geq 0 \\ \text{max} &= 100\% \end{aligned}$$

MOTOR DATA

MMI Menu Map	
1	SETUP
2	MOTOR CONTROL
3	MOTOR DATA
	CONTROL MODE
	POWER
	BASE FREQUENCY
	MOTOR VOLTAGE
	MOTOR CURRENT

	NAMEPLATE RPM
	MOTOR CONNECTION
	MOTOR POLES
	POWER FACTOR
	OVERLOAD
	STATOR RES
	LEAKAGE INDUC
	MUTUAL INDUC
	ROTOR TIME CONST

Designed for all Motor Control Modes.

In this function block you enter the details of the motor under control and any available motor nameplate information.

The Autotune feature will determine the MAG CURRENT, STATOR RES, LEAKAGE INDUC, MUTUAL INDUC and ROTOR TIME CONST motor model parameter.

The OVERLOAD parameter determines the allowed level of motor overload. This can be especially useful when operating with motors smaller than the inverter rating.

Motor Data	
** VOLTS / HZ	[1157] CONTROL MODE
** 5.50 kW	[1158] POWER
** 50.0 Hz	[1159] BASE FREQUENCY
** 400.0 V	[1160] MOTOR VOLTAGE
** 11.30 A	[64] MOTOR CURRENT
** 3.39 A	[65] MAG CURRENT
** 1445.0 rpm	[83] NAMEPLATE RPM
** STAR	[124] MOTOR CONNECTION
** 4 POLE	[84] MOTOR POLES
** 0.90	[242] POWER FACTOR
** 2.0	[1164] OVERLOAD
** 1.3625 Ohm	[119] STATOR RES
** 43.37 mH	[120] LEAKAGE INDUC
** 173.48 mH	[121] MUTUAL INDUC
276.04 ms	[1163] ROTOR TIME CONST

Parameter Descriptions

CONTROL MODE

Range: Enumerated - see below

Determines the main method of motor control used by the inverter.

Enumerated Value : Control Mode

- 0 : VOLTS / HZ
- 1 : SENSORLESS VEC
- 2 : CLOSED-LOOP VEC
- 3 : 4-Q REGEN

POWER

Range: 0.00 to 355.00kW

This parameter contains the motor nameplate power.

BASE FREQUENCY

Range: 7.5 to 1000.0Hz

This parameter contains the motor nameplate base frequency. Refer to FLUXING, page 1-37.

MOTOR VOLTAGE

Range: 0.0 to 575.0V

This parameter contains the motor nameplate voltage at base frequency. Refer to VOLTAGE CONTROL, page 1-134.

MOTOR CURRENT

Range: 0.00 to 595.00A

This parameter contains the motor nameplate full-load line current.

MAG CURRENT

Range: 0.00 to 595.00A

This parameter contains the motor model no-load line current as determined by the auto-tune.

1-56 Programming Your Application

NAMEPLATE RPM

Range: 0.0 to 32000.0 rpm

This parameter contains the motor nameplate full-load rated speed. This is the motor speed in rpm at base frequency minus full load slip.

MOTOR CONNECTION

Range: Enumerated - see below

This parameter contains the motor nameplate connection.

Enumerated Value : Motor Connection

- 0 : DELTA
- 1 : STAR

MOTOR POLES

Range: Enumerated - see below

This parameter contains the motor nameplate pole-pairs.

Enumerated Value : Motor Poles

- 0 : 2 pole
- 1 : 4 pole
- 2 : 6 pole
- 3 : 8 pole
- 4 : 10 pole
- 5 : 12 pole

POWER FACTOR

Range: 0.50 to 0.99

This parameter contains the motor nameplate full-load power factor.

OVERLOAD

Range: 1.0 to 5.0

This parameter contains the allowable motor overload factor. It is used to match the inverter current measurement range to the motor. The inverter is set up so that the **Motor Current x Overload** can be measured up to a maximum of 2 x the Inverter constant torque current rating.

The OVERLOAD parameter has no effect on the current, inverse time or torque limits.

STATOR RES

Range: 0.00 to 250.00 Ohm

This parameter contains the motor model per-phase stator resistance as determined by Autotune.

LEAKAGE INDUC

Range: 0.0 to 300.0 mH

This parameter contains the motor model per-phase leakage inductance as determined by Autotune.

MUTUAL INDUC

Range: 0.0 to 3000.0 mH

This parameter contains the motor model per-phase mutual inductance as determined by Autotune.

ROTOR TIME CONST

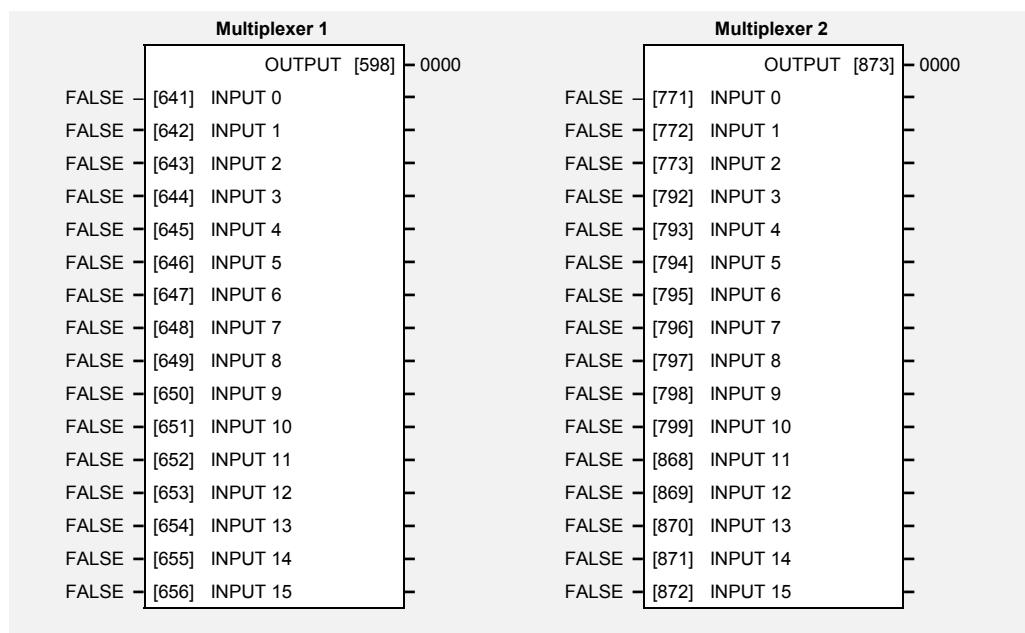

Range: 10.00 to 3000.00

This parameter contains the motor model rotor time constant as determined by Autotune.

The Boolean inputs to be assembled into a single word.

Range: FALSE / TRUE

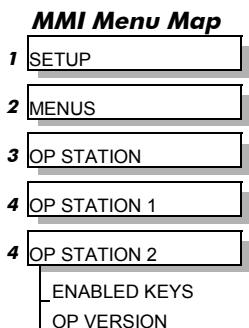

OUTPUT

The resulting word.

Range: 0000 to FFFF

1-58 Programming Your Application

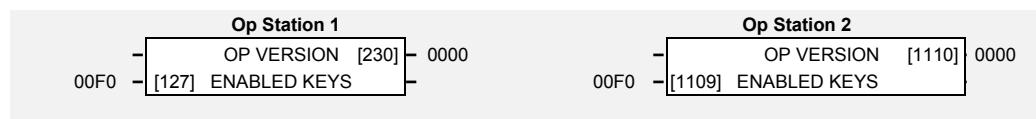

OP STATION

The operator station blocks allow the operation of the Operator Station control keys to be customised.

OP STATION 1 is associated with the Operator Station port.

OP STATION 2 is associated with the Communications port (P3).

Parameter Descriptions

ENABLED KEYS

Range: 0000 to FFFF

The following keys on the Operator Station can be enabled or disabled separately. The combination produces the parameter setting as in the table below.

Parameter Setting	RUN	L/R	JOG	DIR
0000	-	-	-	-
0010	-	-	-	ENABLED
0020	-	-	ENABLED	-
0030	-	-	ENABLED	ENABLED
0040	-	ENABLED	-	-
0050	-	ENABLED	-	ENABLED

Parameter Descriptions

PARAMETER

Range: 0 to 1999

Enter the parameter to be displayed in the Operator menu. The parameter may be selected by first choosing the block that the parameter is within, then choosing the parameter itself.

NAME

Range: 16 characters maximum

Enter your customised parameter name, the maximum length is 16 characters. If this name is left blank, then default parameter name will be used.

SCALING

Range: See below

Selects a DISPLAY SCALE function block to be applied to the value of PARAMETER.

Enumerated Value : DISPLAY SCALE function block

- 0 : NONE
- 1 : DISPLAY SCALE 1
- 2 : DISPLAY SCALE 2
- 3 : DISPLAY SCALE 3
- 4 : DISPLAY SCALE 4

READ ONLY

Range: FALSE / TRUE

When TRUE, this entry in the Operator Menu will not be adjustable.

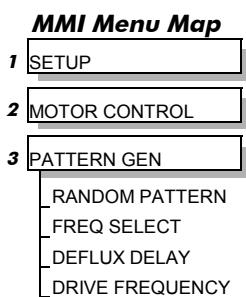

IGNORE PASSWORD

Range: FALSE / TRUE

When TRUE, this entry in the Operator Menu may be adjusted regardless of the password protection feature.

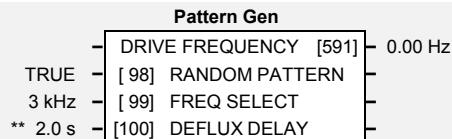

1-62 Programming Your Application

PATTERN GEN

Designed for all Motor Control Modes.

The pattern generator function block allows you to configure the Inverter PWM (Pulse Width Modulator) operation.

Parameter Descriptions

RANDOM PATTERN

Range: FALSE / TRUE

This parameter selects between random pattern (quiet motor noise) or the more conventional fixed carrier PWM strategies. When TRUE, random pattern is enabled.

FREQ SELECT

Range: Enumerated - see below

This parameter selects the base switching frequency of the output power stack. The choices of switching frequency are:

Enumerated Value : Frequency

- 0 : 3 kHz
- 1 : 6 kHz
- 2 : 9kHz

Note: The highest selectable frequency is product dependent

The higher the switching frequency, the lower the level of motor audible noise. However, this is only achieved at the expense of increased Inverter losses.

Refer also to “Quadratic/Constant Torque Selection”, page 1-136.

DEFLUX DELAY

Range: 0.1 to 10.0 s

Sets the minimum allowed delay between disabling and then re-enabling PWM production (i.e. stopping and starting the drive).

DRIVE FREQUENCY

Range: —.x Hz

The Inverter output frequency.

Functional Description

The Inverter provides a unique quiet pattern PWM strategy in order to reduce audible motor noise. The user is able to select between the quiet pattern or the more conventional fixed carrier frequency method. With the quiet pattern strategy selected (random pattern enabled), audible motor noise is reduced to a dull hiss.

In addition, the user is able to select the PWM carrier frequency. This is the main switching frequency of the power output stage of the Frequency Inverter. A high setting of carrier frequency (e.g. 6kHz) reduces audible motor noise but only at the expense of higher Inverter losses and smooth motor rotation at low output frequencies. A low setting of carrier frequency (e.g. 3kHz), reduces Inverter losses but increases audible motor noise.

Designed for use with the System Board.

This function block calculates the gear ratio between the master and slave shafts from the relative repeat lengths calculated from the marker inputs.

The relative repeat lengths are then used to calculate the relative velocities of the master and slave in order to synchronise them; without this, register control is not possible.

Included in this block is logic for discriminating against missing and false (premature) marks (Windowing).

The results of the gearing calculation are filtered and then applied using the Gearing in the Phase Control Block.

This function block must be enabled in order to use the PHASE REGISTER function block.

1.000	[1587]	FILTER
FALSE	[1588]	RESET COUNTERS

Parameter Descriptions

SLAVE LENGTH

Range: — .0000

Connect to GEARING A in the PHASE CONTROL function block. See MASTER LENGTH below.

MASTER LENGTH

Range: — .0000

Connect to GEARING B in the PHASE CONTROL function block.

Length is calculated by measuring the distance between good marks and filtering the result. Two filter time constants are available: the first is to allow minimal filtering during the start-up phase, and the second is typically higher to allow the smooth tracking of any changes to web length. The length outputs are persistent as long as no RESET is applied. The last calculated value is saved on power-down.

GEAR CORRECTION

Range: — .0000

A gear correction factor diagnostic, calculated by dividing SLAVE LENGTH by MASTER LENGTH.

EXT MARK SLAVE

Range: FALSE / TRUE

Diagnostic, displays the state of the Slave Mark input.

EXT MARK MASTER

Range: FALSE / TRUE

Diagnostic, displays the state of the Master Mark input.

FALSE M MARKS

Range: 0 -

Diagnostic counter for false (early) marks. False marks are those that occur before the window is open.

FALSE S MARKS

Range: 0 -

Diagnostic counter for false (early) marks. False marks are those that occur before the window is open.

MISSED M MARKS

Range: 0 -

Diagnostic counter for missing (late) marks. Missing marks are those that occur after the window.

1-64 Programming Your Application

MISSED S MARKS

Range: 0 -

Diagnostic counter for missing (late) marks. Missing marks are those that occur after the window.

MASTER MARKS

Range: 0 -

Diagnostic counter for valid marks. If the block is not in reset, length is calculated when a new valid mark has arrived.

SLAVE MARKS

Range: 0 -

Diagnostic counter for valid marks. If the block is not in reset, length is calculated when a new valid mark has arrived.

READY

Range: FALSE / TRUE

This is set FALSE by reset or power-on. It goes TRUE after the initial repeat counter is passed.

SLAVE MARK POS

Range: —.xxxx

Indicates the distance to the slave mark.

MASTER MARK POS

Range: —.xxxx

Indicates the distance to the slave mark.

RESET

Range: FALSE / TRUE

If TRUE, then the length counters are reset to zero. The length outputs are set to their nominal values and the repeat counter is reset setting the filter time constant to INITIAL FILTER. When the function block comes out of reset, the counters and length calculation will become active again.

ENABLE

Range: FALSE / TRUE

If FALSE, then the length counters are reset to zero. RESET and ENABLE are functionally equivalent. RESET being the inverse of ENABLE.

HOLD

Range: FALSE / TRUE

If TRUE the length calculation is suspended and the last outputs are held..

NOM MASTER LEN

Range: 0.0000 to 100.0000

The nominal length to the next required mark.

NOM SLAVE LENGTH

Range: 0.0000 to 100.0000

The nominal length to the next required mark.

INITIAL REPEATS

The number of valid marks that must be seen on both channels before the block is “READY” during which time the Initial Filter Value is used.

INITIAL FILTER

Range: —.000

The length filter value used during the start-up phase (while the block is not “READY”) See also “FILTER”

FILTER

Range: —.000

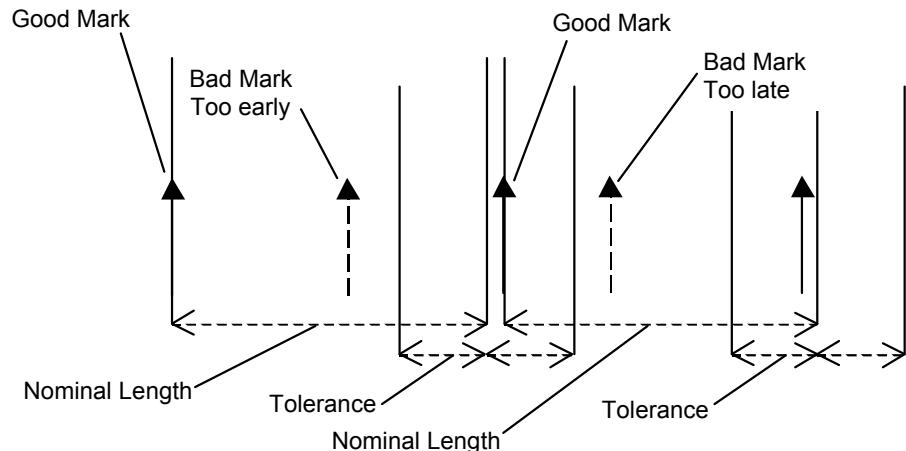

The filter is run only when a new valid mark has arrived (this ties the filter Tc to the number of marks per second, and not time).

RESET COUNTERS

Range: FALSE / TRUE

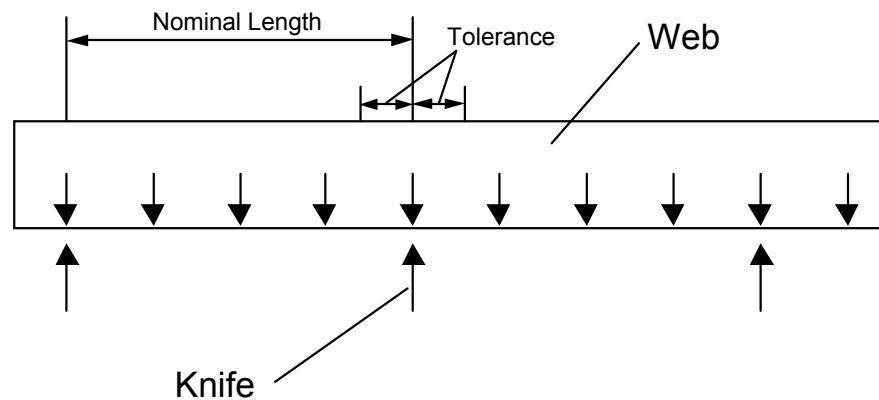

Resetting the counters (TRUE) clears the error counters but **does not** clear the repeat counters and so leaves the filter Tc unchanged.

Functional Description

Setting a window using the nominal repeat length and tolerance eliminates rogue marks. The window opens before the expected arrival point and remains open until a mark arrives. If the new mark is inside the window it is accepted and a new mark is looked for, otherwise it is rejected.

This form of windowing allows for the rejection of repetitive marks that fall regularly between repeats on the other channel. An example of this would be a knife that cut every N marks on the web. In this case it would not matter which mark the knife synchronised to.

This form of windowing will not work as a means of discriminating against noise between marks. If used in a system like this, a missing mark may result in the system synchronising to the noise. For more complex forms of mark discrimination, an intelligent eye must be used.

A large number of false marks will indicate that the system may not work reliably. Check the quality of the sensors and increase measures to reduce EMC interference.

PHASE CONFIGURE

MMI Menu Map

	MASTER POSITION
	SLAVE POSITION
	FAULT

Designed for use with the System Board.

This function block configures the Encoder functions for use with a dual encoder. The parameters in this block allow you to set up which encoder inputs are used for which function, as well as the normalisation parameters.

The slave axis is defined as the axis that the controller is controlling. The "Master" axis also known as the "Reference" axis is the axis that is used as the setpoint, or the axis that the slave follows.

Phase Configure		
MASTER POSITION	[1529]	0
SLAVE POSITION	[1530]	0
FAULT	[1531]	FALSE

	[1834]	SLAVE INVERT
	[1837]	MASTER INVERT
PULSE	[1561]	MASTER MARK TYPE
PULSE	[1562]	SLAVE MARK TYPE

Note: Without the System Board fitted, the SLAVE CNT SOURCE may be set to TB ENCODER. This will allow all blocks that rely on the Slave Encoder only to function as expected. The MARK inputs **do not** function without a System Board.

Parameter Descriptions

SLAVE CNT SOURCE

Range: Enumerated – see below

The slave encoder counter may be "clocked" using either the SLAVE ENCODER encoder quadrature input or the TB ENCODER TechBox encoder quadrature input. The counter is used for the calculation of the slave position.

Enumerated Value : Slave Count Source

- 0 : SLAVE ENCODER
- 1 : TB ENCODER
- 2 : DISABLE

SPD LOOP SPD FBK

Range: Enumerated – see below

The slave axis may use either the SLAVE ENCODER encoder quadrature input or the TB ENCODER TechBox encoder quadrature input for its speed feedback source for closed loop speed control.

The speed feedback encoder should always be directly mounted to the motor that the controller is powering. The speed feedback encoder may be different from the encoder used for position control i.e. the SLAVE CNT SOURCE.

Enumerated Value : Speed Loop Speed Feedback

- 0 : SLAVE ENCODER
- 1 : TB ENCODER

COUNTS PER UNIT

Range: 0 to 32767

This parameter sets the global scaling of position setpoint and feedback. For example, if you wished to work in revolutions and had a 2048 line encoder on the slave then you would set "COUNTS PER UNIT" to $2048 \times 4 = 8192$. This is the number of lines per revolution times 4, it is times 4 because there are 2 edges (1 rising and 1 falling) from both the A and B input of a quadrature encoder.

HIPER COUNT/REV*Range: 0 to 32767*

Hiperface counts per revolution. This scales the Sin Cos encoder to have the equivalent number of lines as on incremental encoders. Setting a value of 32768 is equivalent to having an 8192 line encoder (32768 counts per revolution).

Enumerated Value : Hiper Count/Rev

0	:	1024
1	:	2048
2	:	4096
3	:	8192
4	:	16384
5	:	32768
6	:	65536
7	:	131072
8	:	262144
9	:	524288
10	:	1048576
11	:	2097152
12	:	4194304

1ms CYCLE RATE*Range: 0 to 32767*

Setting this TRUE boosts the execution rate of the phase loop to 1ms, thus improving response.

Note: *Changing from 1ms back to the block diagram rate may make the loops unstable.*

MAX SPEED*Range: 0 to 32000 upm*

This is used to scale the velocity feed forward terms from the PHASE INCH, PHASE MOVE and PHASE REGISTER blocks. It is important that this matches the full speed of the drive.

MASTER SCALE A*Range: -30000 to 30000*

The master encoder counts are scaled by MASTER SCALE A and MASTER SCALE B where A is the multiplier and B is the divisor.

$$\text{MasterPosition} = \text{ActualPosition} \times \left(\frac{\text{MasterScaleA}}{\text{MasterScaleB}} \right)$$

It is not possible to scale the slave encoder.

MASTER SCALE B*Range: -30000 to 30000*

Master encoder scaling parameter, see MASTER SCALE A

SLAVE INVERT*Range: FALSE / TRUE*

Inverts the sign of the slave encoder input at source when set to TRUE.

MASTER INVERT*Range: FALSE / TRUE*

Inverts the sign of the slave encoder input at source when set to TRUE.

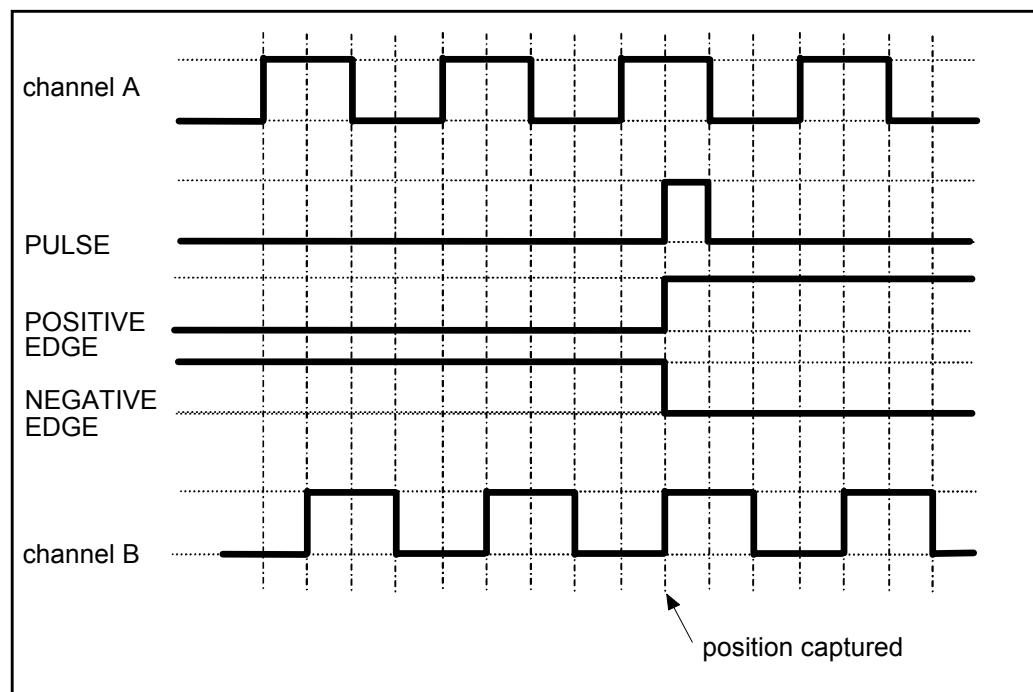

MASTER MARK TYPE

Range: See below

Selects the mark type. As used to capture master/slave position. Only select PULSE is the mark comes from the Master Encoder.

Enumerated Value : Mark Type

- 0 : PULSE
- 1 : POSITIVE EDGE
- 2 : NEGATIVE EDGE

SLAVE MARK TYPE

Range: See below

See MASTER MARK TYPE above.

MASTER POSITION

Range: —.

Diagnostic output in encoder counts from the master quadrature encoder. This is the scaled master counter value and will wrap around from maximum positive to minimum negative if the counter overflows.

SLAVE POSITION

Range: —.

Diagnostic output in encoder counts from the slave quadrature encoder. This is the raw counter value and will wrap around from maximum positive to minimum negative if the counter overflows.

FAULT

Range: NONE / OVERFLOW

This is a general error flag used by the underlying encoder function blocks. The error will be set to OVERFLOW if the position error counter overflows and counts are lost.

FALSE	[1487] INVERT OUTPUT	

Parameter Descriptions

RESET (TOTAL)

Range: FALSE / TRUE

Total Reset, disables both the SPEED OUPUT and PHASE LOOP, see POSITION ENABLE.

POSITION ENABLE

Range: FALSE / TRUE

The position enable input. Enables the operation of the accumulator. If set FALSE, then the accumulator is set to zero and any phase information is reset. See also RESET (TOTAL).

SPEED INPUT

Range: —.xx

Input to the speed feed-forward calculator, to obtain good phase locking it is important that this input is used. The speed input will usually be the master line speed, this input should be set such that the slave will follow the master even with the phase loop disabled.

INVERT SPEED OP

Range: FALSE / TRUE

Invert the speed output.

GEARING A

Range: -30000 to 30000

Gearing allows the slave to run at a ratio of the master speed / position.

$$\text{MasterPosition} = \text{ActualMasterPosition} \times \left(\frac{\text{GearingA}}{\text{GearingB}} \right)$$

$$\text{SpeedOutput} = \text{SpeedInput} \times \left(\frac{\text{GearingA}}{\text{GearingB}} \right)$$

GEARING B

Range: -30000 to 30000

See Gearing A

FDFWD SCALE

Range: -300.00 to 300.00

Scale position feed-forward. Scaled with PHASE CONFIG::MAX SPEED. This feed forward works only for position setpoint changes and is designed to reduce the following error of the system by predicting the torque required to accelerate the motor.

OUTPUT SCALE

Range: 0.00 to 300.00

Scales the position output.

INVERT OUTPUT

Range: FALSE / TRUE

Inverts the position output.

1-70 Programming Your Application

OUTPUT

Range: —.xx

Position output used for PHASE PID. Note: The output of this block contains valid information beyond the final decimal place, the information is passed to PHASE PID and is used for maximum precision.

SPEED OUTPUT

Range: —.xx

Speed output, used for PHASE PID:: FEED FWD input. Includes POS FEED FWD.

POS FEED FWD

Range: —.xx

Position feed-forward output.

SLAVE POS (INT)

Range: 0 -

Slave position in encoder units.

MASTER POS (INT)

Range: 0 -

Geared master position in encoder units.

MASTER POS

Range: —.

Geared Master position as a scaled integer.

MASTER POSITION

Range: —.xx

Geared Master position scaled in encoder units.

MSTR POS+OFFSET

Range: —.xx

Geared Master position + offset. This is master position demand.

SLAVE POSITION

Range: —.xx

Slave position scaled in encoder units.

POS ERROR INT

Range: —.

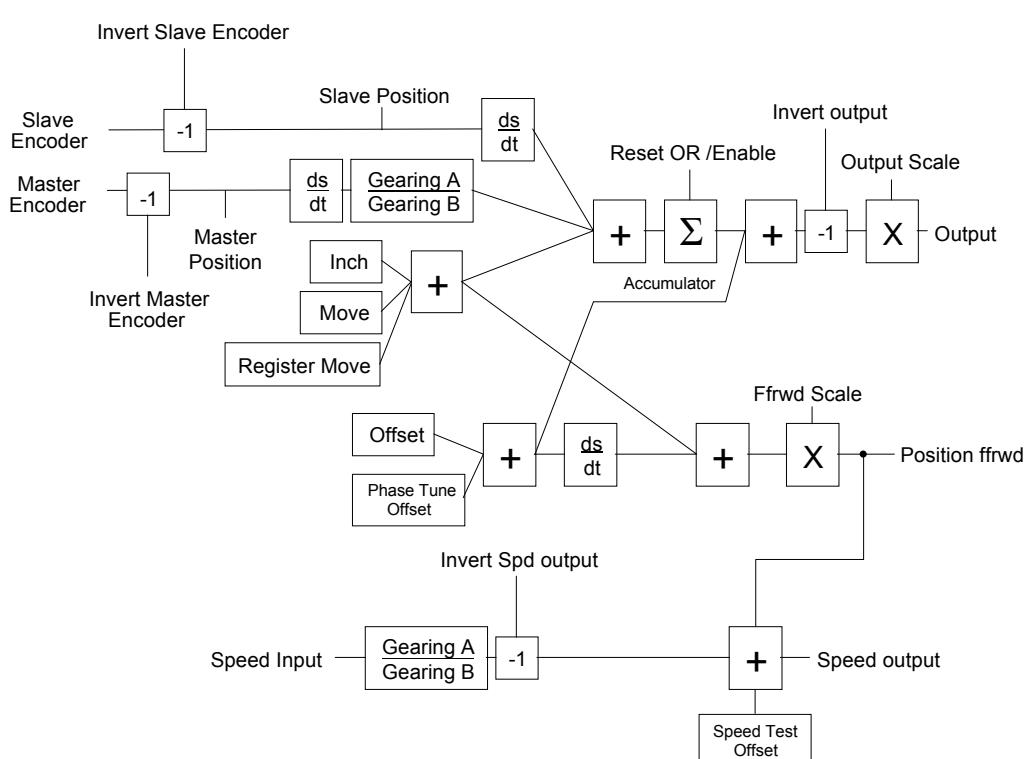

Position error scaled in scaled counts.

POSITION ERROR

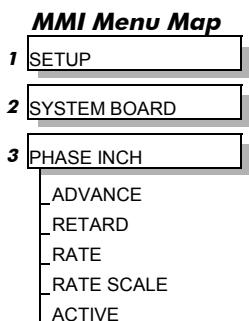

Range: —.xx

Position error scaled in encoder units.

Functional Description

PHASE INCH

When in Phase control, the Phase Inch function block may be used to advance or retard the relative position on the slave axis with respect to the master axis. This is achieved by feeding extra counts into the position error calculator at a rate given by RATE in units per second.

If Register Mode is enabled, the MARK OFFSET is also effected.

ADVANCE and RETARD are usually linked to operator controlled, momentary-action push buttons.

Phase Inch	
ACTIVE	[1503]
FALSE	- [1500] ADVANCE
FALSE	- [1501] RETARD
0.1000	- [1502] RATE
1.000	- [1699] RATE SCALE

Parameter Descriptions

ADVANCE

Range: FALSE / TRUE

While TRUE, counts are added to the error calculator at a rate give by RATE. Note: if both ADVANCE and RETARD are TRUE then no action is taken.

RETARD

Range: FALSE / TRUE

While TRUE, counts are subtracted from the error calculator at a rate given by RATE.

RATE

Range: 0.0001 to 30.0000

The rate at which counts are added to the Error calculator. A rate of 0.05 with a system scaled in revolutions would cause the drive to advance at a rate of 0.05 revolutions a second with respect to the master.

RATE SCALE

Range: 0.001 to 30.000

This allows fine control over the inch rate by scaling the value of RATE.

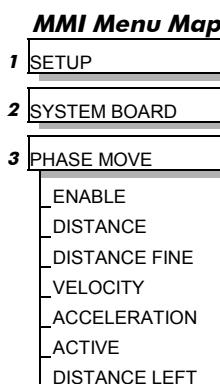

$$\text{Actual Rate} = \text{RATE} \times \text{RATE SCALE}$$

ACTIVE

Range: FALSE / TRUE

This diagnostic displays TRUE while Advance or Retard actions are active.

PHASE MOVE

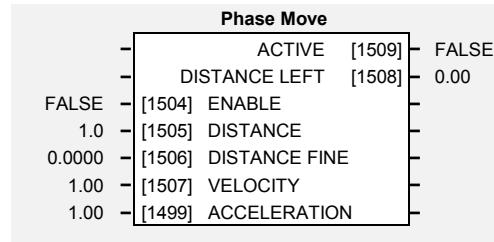

This is a simple trapezoidal relative move function, which acts on each rising edge of the Enable input. The slave shaft is moved a fixed distance at a rate given by the VELOCITY parameter. A move must be complete before a new move will be registered.

If Register Mode is enabled, the MARK OFFSET is also effected.

The move operation is aborted by the RESET (TOTAL) and POSITION ENABLE parameters in the PHASE CONTROL function block.

The move operation will automatically generate a velocity feed forward signal. It is important to verify that is correct. The PHASE PID function block output, PID OUTPUT, should remain near zero. If this is not the case, check the MAX SPEED parameter in the PHASE CONFIGURE function block.

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

If the function block is not already Active, ENABLE starts the Move operation when going from FALSE to TRUE. Setting ENABLE to FALSE while a move is active will NOT abort the operation.

DISTANCE

Range: -3000.0 to 3000.0

The coarse distance that the move command will add to the phase loop.

DISTANCE FINE

Range: -1.0000 to 1.0000

Additional distance to allow fine control of position.

VELOCITY

Range: 0.10 to 3000.00

The maximum velocity at which the distance is added to the phase loop, set in units per second.

ACCELERATION

Range: 0.10 to 3000.00

The acceleration at which the distance is added to the phase loop, set in units per second².

ACTIVE

Range: FALSE / TRUE

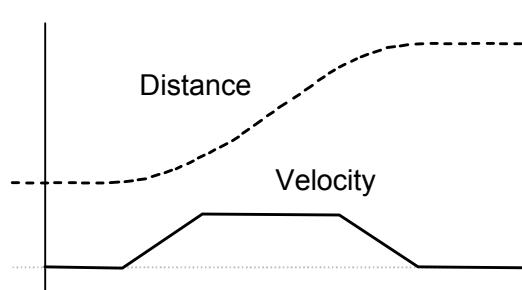

TRUE while the block is Active, i.e. the move distance is none zero.

DISTANCE LEFT

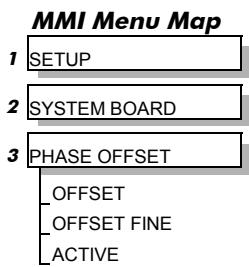

Range: —.xx

Diagnostic showing the distance remaining before the move is complete.

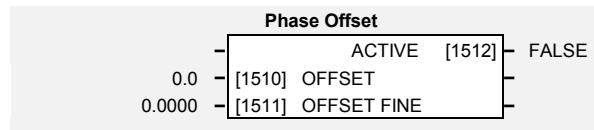

Functional Description

PHASE OFFSET

The Offset function block adds an offset to the error calculator. This is unramped.

$$\text{PhaseOutput} = \text{Error} + \text{Offset} + \text{OffsetFine}$$

Parameter Descriptions

OFFSET

Range: -3000.0 to 3000.0

A course offset added to the phase error, allowing an absolute phase correction to be applied. The Offset is added to the Phase at a maximum rate of +/-32768 counts.

OFFSET FINE

Range: -1.0000 to 1.0000

Additional correction added to OFFSET to allow fine control of position.

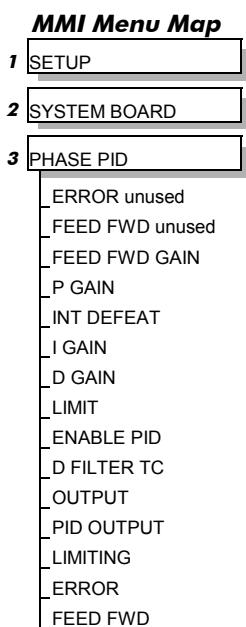

ACTIVE

Range: FALSE / TRUE

TRUE while offset count is being added.

1-74 Programming Your Application

PHASE PID

This function block is an alternative, simplified version of the process PID controller and is dedicated to phase control.

The PID correction, PID OUTPUT, is internally connected to PHASE INPUT in the SPEED LOOP function block.

Phase PID

OUTPUT [1522]	0.00 %
PID OUTPUT [1549]	0.00 %
LIMITING [1523]	FALSE
ERROR [1679]	0.00%
FEED FWD [1680]	0.00%
FALSE [1520]	ENABLE
0.00 % [1513]	ERROR unused
0.00% [1514]	FEED FWD unused
1.00 [1515]	FEED FWD GAIN
0.10 [1516]	P GAIN
FALSE [1843]	INT DEFEAT
1.00 [1517]	I GAIN
0.00 [1518]	D GAIN
0.05 s [1521]	D FILTER TC
300.00% [1519]	LIMIT

Parameter Descriptions

OUTPUT

Range: __.xx%

Output of the PHASE PID function block - scaled feed forward. This is a new feature for software version 5.x and the correction is now connected directly to the PHASE INPUT parameter in the SPEED LOOP function block.

PID OUTPUT

Range: __.xx%

Output of PID without FEED FWD.

LIMITING

Range: FALSE / TRUE

This output is TRUE if the OUTPUT is at the LIMIT value.

ERROR

Range: —.xx

This diagnostic position error is internally connected to OUTPUT in the PHASE CONTROL function block.

FEED FWD

Range: —.xx

This diagnostic feed forward is internally connected to POS FEED FWD in the PHASE CONTROL function block.

ENABLE PID

Range: FALSE / TRUE

This parameter globally resets the PID output and integral term when FALSE.

This parameter must be TRUE for the PID to operate.

ERROR unused

Range: -300.00 to 300.00 %

Previously used for connection to PHASE CONTROL::OUTPUT. This connection is now made internally.

FEED FWD unused

Range: -300.00 to 300.00 %

Previously used for connection to PHASE CONTROL::POS FEED FWD. This connection is now made internally.

FEED FWD GAIN

Range: -300.00 to 300.00

Feed forward gain of the PHASE PID block.

P GAIN

Range: 0.00 to 3000.00

The proportional gain of the PHASE PID block.

INT DEFEAT

Range: FALSE / TRUE

The PID Integral term is defeated when set to TRUE.

I GAIN*Range: 0.00 to 100.00*

The integral gain of the PHASE PID block.

D GAIN*Range: 0.00 to 100.00*

The derivative gain of the PHASE PID block.

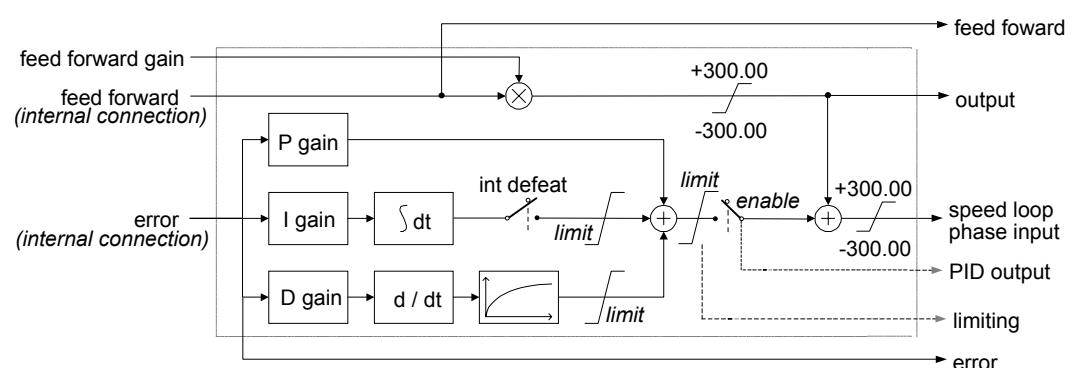

D FILTER TC*Range: 0.05 to 10.00 s*

In order to help attenuate high frequency noise on the derivative term, a first order lag has been provided. This parameter determines the filter time constant.

LIMIT*Range: 0.00 to 300.00%*

This parameter determines the maximum positive and negative excursion (Limit) of the PID output.

Functional Description

- Functions as P, PI, PD and PID with filtering.
- Single symmetric limit on output.

PID Stage

The formula which describes the action of the PID in the 'S' domain is as follows:

$$PID = K_P + \frac{K_i}{S} + K_D \frac{S}{1 + S T_F}$$

where: K_P is the proportional gain

K_i is the integral gain

K_D is the derivative gain

T_F is the filter time constant

PHASE REGISTER

MMI Menu Map	
1	SETUP
2	WINDER

	RESET
	ENABLE
	MARK OFFSET
	SLAVE NOM LENGTH
	VELOCITY
	ACCELERATION
	CORRECTIONS
	STATUS
	INCH OFFSET
	ERROR COUNTS
	ERROR

Designed for use with System Board, V1.2 only.

The register loop takes master and slave marks in and attempts to align them.

Corrections are applied to the slave access by means of trapezoidal move. In this way, the total error may be corrected within a repeat.

The rate at which the move takes place is set by the VELOCITY and ACCELERATION parameters.

Note: The System Board version is identified by SYSTEM OPTION::VERSION.

Phase Register	
CORRECTIONS	[1570] 0
STATUS	[1571] 0
INCH OFFSET	[1565] 0.0000
ERROR COUNTS	[1572] 0
ERROR	[1573] 0.0000
TRUE	1563] RESET
FALSE	[1564] ENABLE
0.0000	[1566] MARK OFFSET
1.0000	[1567] SLAVE NOM LENGTH
10.00	[1568] VELOCITY
10.00	[1569] ACCELERATION

Parameter Descriptions

CORRECTIONS

Range: —.

Diagnostic counter of valid mark master/slave pairs.

STATUS

Range: —.

Displays the current mode, RESET or ALIGN. When in RESET, the outputs and counters are reset. When in ALIGN, a correction is applied after each new pair of marks have arrived, assuming that the previous correction has been completed.

INCH OFFSET

Range: —.xxxx %

Offset as generated by INCH and MOVE blocks. This is summed with MARK OFFSET to calculate the real offset. INCH OFFSET is only zeroed with a RESET. INCH OFFSET is persistent and so its value will be retained on power-down.

ERROR COUNTS

Range: —.

Error, given in slave encoder counts.

ERROR

Range: —.00

Error, given in units (sometimes so small that it does not register, hence ERROR COUNTS)

RESET

Range: FALSE / TRUE

Disables the block and prevents any corrections taking place. Reset also resets the Inch Offset value leaving.

ENABLE

Range: FALSE / TRUE

When TRUE, corrections are made. When FALSE, corrections are prevented from taking place, but the diagnostic outputs are computed.

MARK OFFSET

Range: -100.0000 to 100.0000

Offsets the slave mark by this fixed distance. The total of the offset is the sum of the offset variable and internal Inch Offset variable. The Inch Offset is calculated from the output of the inch function block and the move function block. Inch offset and offset are both persistent.

SLAVE NOM LENGTH

Range: 0.0000 to 100.0000

The nominal repeat length in units. The nominal length is usually the slave length and is used to calculate the maximum allowed correction.

VELOCITY

Range: 0.10 to 300.00 %

The maximum velocity in % (of PHASE CONFIGURE::MAX SPEED) /s that the correction will be applied.

ACCELERATION

Range: 0.01 to 3000.00 %

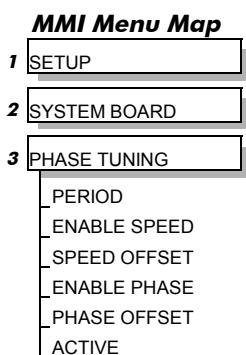

The maximum acceleration/deceleration in % (of PHASE CONFIGURE::MAX SPEED) /s² that the correction will be applied.

Functional Description

The registration loop works using an Instantaneous Registration technique. The error in counts is measured between master and slave marks. This error is then added to the slave position to correct the error. The correction is applied using a move function to limit disturbance to the machine. Ideally the move should be completed before the next mark pair is due.

The correction is limited to \pm nominal length / 2.

PHASE TUNING

The Tuning function block provides a means of injecting a speed offset or a phase offset in the form of a square wave to assist the tuning of the speed and phase loops. It would be unusual for both tests to be active together.

Phase Tuning	
ACTIVE	[1478]
10.00 s	- [1473] PERIOD
FALSE	- [1844] SINE WAVE
FALSE	- [1474] ENABLE SPEED
1.00 %	- [1475] SPEED OFFSET
FALSE	- [1476] ENABLE PHASE
1.00	- [1477] PHASE OFFSET

Parameter Descriptions

PERIOD

The wave form period in seconds.

Range: 0.10 to 300.00 s

ENABLE SPEED

Enables SPEED OFFSET to be added to the SPEED INPUT (of the Phase Control function block).

Range: FALSE / TRUE

SINE WAVE

Selects a sine wave or square wave stimulus. Sine wave = TRUE.

Range: FALSE / TRUE

SPEED OFFSET

Range: -300.00 to 300.00 %

The speed offset value.

ENABLE PHASE

Range: FALSE / TRUE

Enable PHASE OFFSET to be added to the POSITION OUTPUT (of the Phase Control function block).

PHASE OFFSET

Range: -300.00 to 300.00

Phase offset value. Small values should be used to prevent the torque loop from saturating.

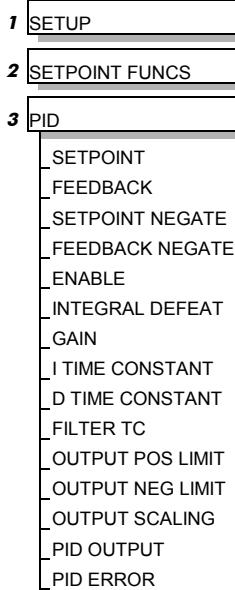

ACTIVE

Range: FALSE / TRUE

Diagnostic. TRUE when either ENABLE SPEED or ENABLE PHASE are active.

PID

MMI Menu Map

This function block allows the Inverter to be used in applications requiring a trim to the setpoint, depending on feedback from an external measurement device. Typically this will be used for process control, i.e. pressure or flow.

PID	
PID OUTPUT [320]	0.00 %
PID ERROR [766]	0.00 %
0.00 %	[310] SETPOINT
0.00%	[764] FEEDBACK
FALSE	[763] SETPOINT NEGATE
FALSE	[765] FEEDBACK NEGATE
FALSE	[311] ENABLE
FALSE	[312] INTEGRAL DEFEAT
1.0	[313] P GAIN
1.00 s	[314] I TIME CONST
0.000 s	[315] D TIME CONST
0.100 s	[316] FILTER TC
100.00 %	[317] OUTPUT POS LIMIT
-100.00 %	[318] OUTPUT NEG LIMIT
1.0000	[319] OUTPUT SCALING

Parameter Descriptions

SETPOINT

Range: -300.00 to 300.00 %

An input to the PID block.

FEEDBACK

Range: -300.00 to 300.00 %

An input to the PID block.

SETPOINT NEGATE

Range: FALSE / TRUE

Changes the sign of SETPOINT.

FEEDBACK NEGATE

Range: FALSE / TRUE

Changes the sign of FEEDBACK.

ENABLE

Range: FALSE / TRUE

This parameter globally resets the PID output and integral term when FALSE.

This parameter must be TRUE for the PID to operate.

INTEGRAL DEFEAT

Range: FALSE / TRUE

This parameter resets the PID integral term when TRUE.

P GAIN

Range: 0.0 to 100.0

This parameter is the true proportional gain of the PID controller. With a P gain of zero, the PID output would be zero.

I TIME CONST

Range: 0.01 to 100.00 s

The integral time constant of the PID controller.

1-80 Programming Your Application

D TIME CONST

Range: 0.000 to 10.000 s

The derivative time constant of the PID controller.

FILTER TC

Range: 0.000 to 10.000 s

In order to help attenuate high frequency noise on the PID output, a first order output filter has been provided. This parameter determines the output filter time constant.

OUTPUT POS LIMIT

Range: 0.00 to 105.00 %

This parameter determines the maximum positive excursion (Limit) of the PID output.

OUTPUT NEG LIMIT

Range: -105.00 to 0.00 %

This parameter determines the maximum negative excursion (Limit) of the PID output.

OUTPUT SCALING

Range: -3.0000 to 3.0000

This parameter represents an overall scaling factor which is applied after the PID positive and negative limit clamps.

PID OUTPUT

Range: —.xx %

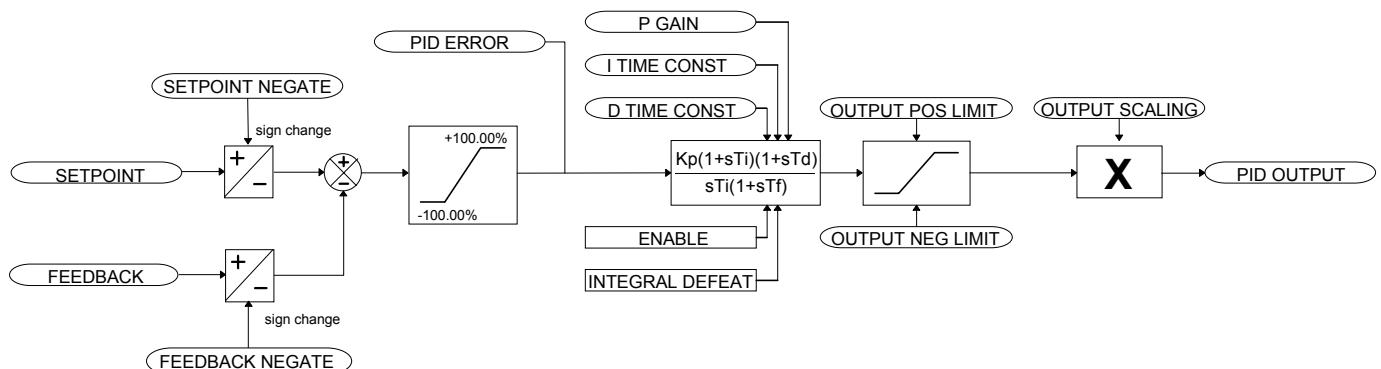

The output of the PID function.

PID ERROR

Range: —.xx %

The result of SETPOINT - FEEDBACK, clamped to between $\pm 100.00\%$.

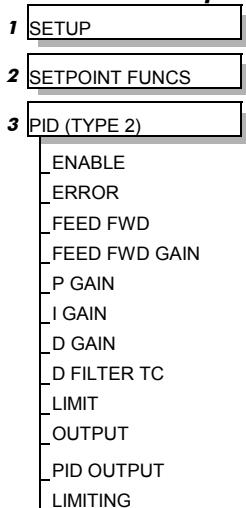

Functional Description

For an application that requires closed loop control, the error term may be derived from the setpoint and feedback using a value function block. This error term is then used by the PID. The output of the PID may be used to trim the demand setpoint via the SPEED TRIM parameter in the REFERENCE function block.

PID (TYPE 2)

MMI Menu Map

This function block is an alternative, simplified version of the process PID controller. The function block is suitable for general closed-loop control and is typically used in phase control applications.

PID (Type 2)

	PID OUPUT [1548]	0.00 %
	OUTPUT [1256]	0.00 %
	LIMITING [1257]	FALSE
FALSE	[1254] ENABLE	
0.00 %	[1247] ERROR	
0.00%	[1248] FEED FWD	
1.00	[1249] FEED FWD GAIN	
0.10	[1250] P GAIN	
1.00	[1251] I GAIN	
0.00	[1252] D GAIN	
0.05 s	[1255] D FILTER TC	
300.00%	[1253] LIMIT	

Parameter Descriptions

ERROR

Error input to the PID (TYPE 2) block.

Range: -300.00 to 300.00 %

FEED FWD

Feed forward input to the PID (TYPE 2) block.

Range: -300.00 to 300.00 %

FEED FWD GAIN

Feed forward gain of the PID (TYPE 2) block.

Range: -300.00 to 300.00

P GAIN

The proportional gain of the PID (TYPE 2) block.

Range: 0.00 to 100.00

I GAIN

The integral gain of the PID (TYPE 2) block.

Range: 0.00 to 100.00

D GAIN

The derivative gain of the PID (TYPE 2) block.

Range: 0.00 to 100.00

LIMIT

This parameter determines the maximum positive and negative excursion (Limit) of the PID output.

Range: 0.00 to 300.00%

ENABLE

This parameter globally resets the PID output and integral term when FALSE. This parameter must be TRUE for the PID to operate.

Range: FALSE / TRUE

D FILTER TC

In order to help attenuate high frequency noise on the derivative term, a first order lag has been provided. This parameter determines the filter time constant.

Range: 0.05 to 10.00 s

OUTPUT

Output of the PID (TYPE 2) function block.

Range: __.xx%

PID OUTPUT

Output of PID without FEED FWD

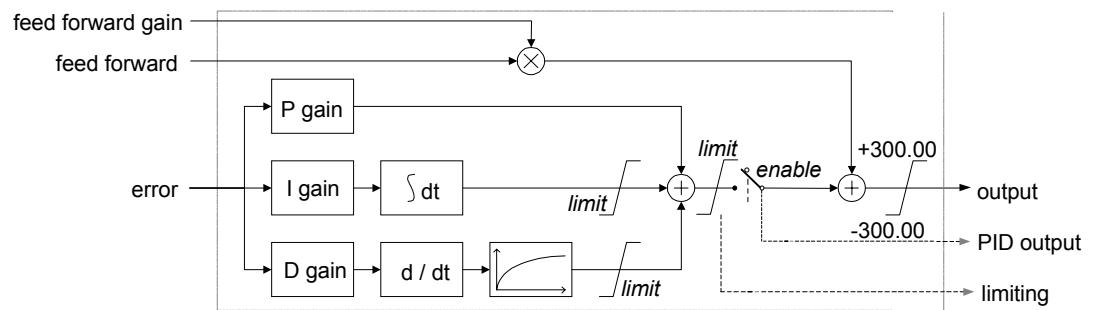

Range: __.xx%

LIMITING

This output is TRUE if the OUTPUT is at the LIMIT value.

Range: FALSE / TRUE

Functional Description

- Functions as P, PI, PD and PID with filtering.
- Single symmetric limit on output.

PID Stage

The formula which describes the action of the PID in the 'S' domain is as follows:

$$PID = K_P + \frac{K_i}{S} + K_D \frac{S}{1 + S T_F}$$

where: K_P is the proportional gain

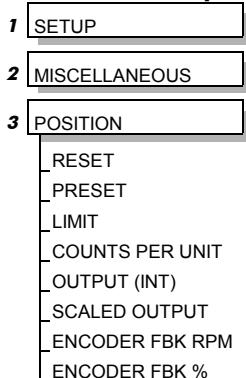

K_i is the integral gain

K_D is the derivative gain

T_F is the filter time constant

POSITION

MMI Menu Map

The Position function block counts the encoder position from reset.

It provides a scaleable output as well as encoder speed diagnostics

If the ENCODER MODE is set to QUADRATURE (refer to the FEEDBACKS function block), then the output will count at 4x the number of lines on the encoder per revolution, otherwise it will count at 1x.

Position	
OUTPUT (INT)	[748] 0
SCALED OUTPUT	[1685] 0.0000
ENCODER FBK RPM	[1687] 0.00 rpm
ENCODER FBK %	[1688] 0.00 %
FALSE	[747] RESET
0.00	[1682] PRESET
100.00	[1683] LIMIT
8192	[1684] COUNTS PER UNIT

Parameter Descriptions

RESET

Range: FALSE / TRUE

Resets OUTPUT (INT) to zero and SCALED OUTPUT to Preset when set to True.

PRESET

Range: -32767.00 to 32767.00

The value to which the SCALED OUTPUT is set when RESET is True

LIMIT

Range: 0.00 to 32767.00

A symmetric limit that clamps the value of SCALED OUTPUT, i.e. SCALED OUTPUT can be no greater than LIMIT and no less than -LIMIT

COUNTS PER UNIT

Range: -2147483647 to 2147483647

The number of encoder counts that are equal to a SCALED OUTPUT of 1.0.

OUTPUT (INT)

Range: —.

The number of counts on the encoder since the block was last reset. The output is preserved during power-down of the Inverter.

SCALED OUTPUT

Range: —.0000

An output scaled such that 1.0 = encoder counts
counts per unit

ENCODER FBK RPM

Range: —.00 rpm

Provides an encoder speed diagnostic in rpm.

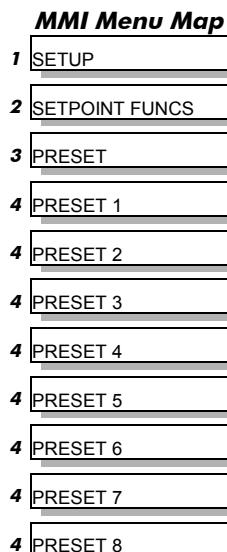

ENCODER FBK %

Range: —.00 %

This parameter shows the mechanical speed of the motor shaft, calculated from the Encoder Technology Box, as a percentage of the user maximum speed setting (MAX SPEED in the SETPOINT SCALE function block).

1-84 Programming Your Application

PRESET

The Inverter has eight Preset function blocks. These are used to select a value from one of eight inputs, depending on the value of another input. A second output is provided to allow the block to be used as two banks of four inputs.

Preset 1		Preset 2	
INPUT 0	[355] SELECT INPUT	INPUT 0	[388] SELECT INPUT

Parameter Descriptions

SELECT INPUT

Range: Enumerated - see below

Determines which of the inputs is routed to OUTPUT 1 . In addition, if SELECT INPUT is in the range 0 to 3, INPUT 4 to INPUT 7 respectively is routed to OUTPUT 2.

Enumerated Value : Select Input

- 0 : INPUT 0
- 1 : INPUT 1
- 2 : INPUT 2
- 3 : INPUT 3
- 4 : INPUT 4
- 5 : INPUT 5
- 6 : INPUT 6
- 7 : INPUT 7

INPUT 0 TO INPUT 7

Range: -300.00 to 300.00

Inputs to the Preset block.

OUTPUT 1

Range: —.xx

Selected input.

OUTPUT 2

Range: —.xx

Selected input (if SELECT INPUT is in the correct range).

Functional Description

The Preset function block is a de-multiplexer.

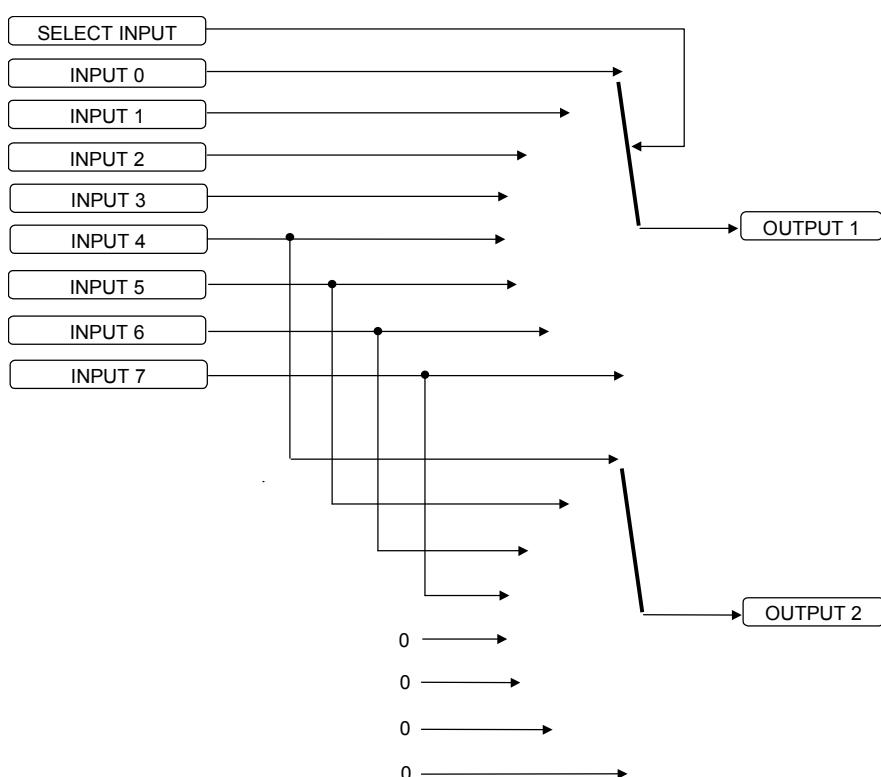

OUTPUT 1 and OUTPUT 2 return the values at selected inputs set by SELECT INPUT.

OUTPUT 2 returns the value of a different input to OUTPUT 1 , i.e:

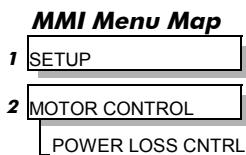

if SELECT INPUT = 0 then OUTPUT 1 = INPUT 0, OUTPUT 2 = INPUT 4

if SELECT INPUT = 1 then OUTPUT 1 = INPUT 1, OUTPUT 2 = INPUT 5 etc.

When SELECT INPUT is set to 4, 5, 6 or 7, OUTPUT 2 will return a value of zero.

POWER LOSS CNTRL

Designed for all Motor Control Modes.

This function block controls the behaviour of the drive during a power outage

When enabled, the drive attempts to keep the dc link high by regeneratively recovering the kinetic energy in the motor load in the event of mains supply loss.

This is achieved by ramping the speed setpoint to zero during the power outage. If during the outage the supply returns, the speed setpoint is automatically ramped back to the speed setpoint.

When disabled, the drive will trip on UNDERVOLTS if the mains supply is removed.

Power Loss Cntrl	
PWR LOSS ACTIVE	[1271] FALSE
** 447V	[1265] ENABLE
20V	[1266] TRIP THRESHOLD
10.00s	[1267] CONTROL BAND
5.00s	[1268] ACCEL TIME
0.00%	[1269] DECEL TIME
30.00s	[1677] INITIAL STEP
	[1270] TIME LIMIT

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

When TRUE, the Power Loss Ride-Through functionality is enabled.

TRIP THRESHOLD

Range: 0V to 1000V

Determines the dc link volts at which the Power Loss Ride-Through sequence is triggered.

CONTROL BAND

Range: 0V to 1000V

Sets the dc link voltage above the TRIP THRESHOLD at which the setpoint Ramp to Stop is paused. If the dc link volts remain above this level for a period greater than 500ms, the setpoint is ramped back to the speed demand.

ACCEL TIME

Range: 0.01 to 300.00s

Determines the time in which the speed setpoint is ramped back to the speed demand. This is expressed as the time to ramp from zero to MAX SPEED.

DECCEL TIME

Range: 0.01 to 300.00s

Determines the time in which the speed setpoint is ramped to zero. This is expressed as the time to ramp from MAX SPEED to zero.

INITIAL STEP

Range: 0.00 to 100.00%

This parameter sets the initial speed reduction step at the start of the power loss control sequence.

TIME LIMIT

Range: 0.00 to 300.00s

Determines the maximum allowed time of the Power Loss Ride-Through sequence. Once timeout is reached, the drive is allowed to Coast to Stop and eventually trip on UNDERVOLTS.

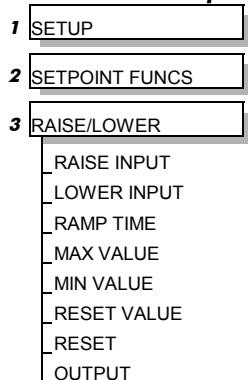

PWR LOSS ACTIVE

Range: FALSE / TRUE

This diagnostic is set to TRUE while the Power Loss Ride-Through sequence is active.

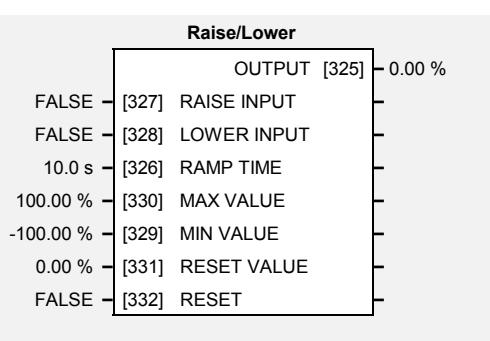

RAISE/LOWER

MMI Menu Map

This function block acts as an internal motorised potentiometer (MOP).

The OUTPUT is preserved during the power-down of the Inverter.

Parameter Descriptions

RAISE INPUT

Range: FALSE / TRUE

When TRUE causes OUTPUT to ramp up.

LOWER INPUT

Range: FALSE / TRUE

When TRUE causes OUTPUT to ramp down.

RAMP TIME

Range: 0.0 to 600.0 s

Rate of change of the OUTPUT . Defined as time to change from 0.00% to 100.00% . Note that the raise and lower rates are always the same.

MAX VALUE

Range: -300.00 to 300.00 %

The maximum value to which OUTPUT will ramp up to.

MIN VALUE

Range: -300.00 to 300.00 %

The minimum value to which OUTPUT will ramp down to.

RESET VALUE

Range: -300.00 to 300.00 %

The value the OUTPUT is set to when RESET is TRUE.

RESET

Range: FALSE / TRUE

When TRUE, forces OUTPUT to track RESET VALUE .

OUTPUT

Range: —.xx %

The ramped output. This parameter is persistent, that is, it is saved throughout a power failure.

Functional Description

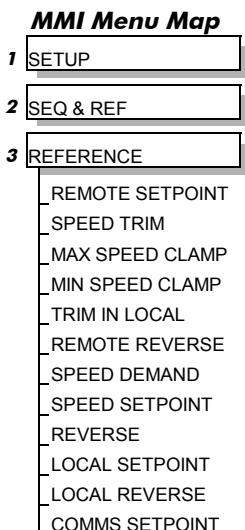

The table below describes how OUTPUT is controlled by the RAISE INPUT, LOWER INPUT and RESET inputs.

RESET	RAISE INPUT	LOWER INPUT	Action
TRUE	Any	Any	OUTPUT tracks RESET VALUE
FALSE	TRUE	FALSE	OUTPUT ramps up to MAX VALUE at RAMP TIME
FALSE	FALSE	TRUE	OUTPUT ramps down to MIN VALUE at RAMP TIME
FALSE	FALSE	FALSE	OUTPUT not changed. *
FALSE	TRUE	TRUE	OUTPUT not changed. *

* If OUTPUT is greater than MAX VALUE the OUTPUT will ramp down to MAX VALUE at RAMP TIME. If OUTPUT is less than MIN VALUE the OUTPUT will ramp up to MIN VALUE at RAMP TIME.

IMPORTANT: If MAX VALUE is less than or equal to MIN VALUE, then OUTPUT is set to MAX VALUE.

REFERENCE

This function block holds all the parameters concerning the generation of the setpoint reference.

The generation of reference setpoint is described in the Installation Product Manual, Chapter 4: "Operating the Inverter" - Control Philosophy.

Reference	
SPEED DEMAND	[255] 0.00 %
SPEED SETPOINT	[254] 0.00 %
REVERSE	[256] FALSE
LOCAL SETPOINT	[247] 0.00 %
LOCAL REVERSE	[250] FALSE
COMMS SETPOINT	[770] 0.00 %
0.00 %	[245] REMOTE SETPOINT
0.00 %	[248] SPEED TRIM
110.00 %	[252] MAX SPEED CLAMP
-110.00 %	[253] MIN SPEED CLAMP
FALSE	[243] TRIM IN LOCAL
FALSE	[249] REMOTE REVERSE

Parameter Descriptions

REMOTE SETPOINT

Range: -300.00 to 300.00 %

This is the target reference that the Inverter will ramp to in remote reference mode (not including trim), direction is taken from REMOTE REVERSE and the sign of REMOTE SETPOINT.

SPEED TRIM

Range: -300.00 to 300.00 %

The trim is added to the ramp output in remote mode (or if TRIM IN LOCAL is TRUE) to form SPEED DEMAND . The trim is typically connected to the output of a PID in a closed loop system.

Note: The output of the REFERENCE RAMP is set to -SPEED TRIM when the drive is started to ensure that the SPEED DEMAND ramps from zero.

MAX SPEED CLAMP

Range: 0.00 to 110.00 %

Maximum value for SPEED DEMAND.

MIN SPEED CLAMP

Range: -110.00 to 0.00 %

Minimum value for SPEED DEMAND.

TRIM IN LOCAL

Range: FALSE / TRUE

When TRUE, SPEED TRIM is always added to the ramp output. When FALSE, SPEED TRIM is added only to Remote mode.

REMOTE REVERSE

Range: FALSE / TRUE

Demand direction when in Remote Reference mode. This is usually connected directly to the Sequencing Logic.

SPEED DEMAND

Range: —.x %

Indicates actual speed demand. This is the input to the frequency controller.

SPEED SETPOINT

Range: —.x %

Indicates target speed. This will be equal to either LOCAL SETPOINT, REMOTE SETPOINT, JOG SETPOINT or COMMS SETPOINT. (Refer to the REFERENCE JOG function block for the JOG SETPOINT parameter).

REVERSE

Range: FALSE / TRUE

Indicates demanded direction. This may not be the actual direction as no account of setpoint sign is taken.

LOCAL SETPOINT

Range: —.xx %

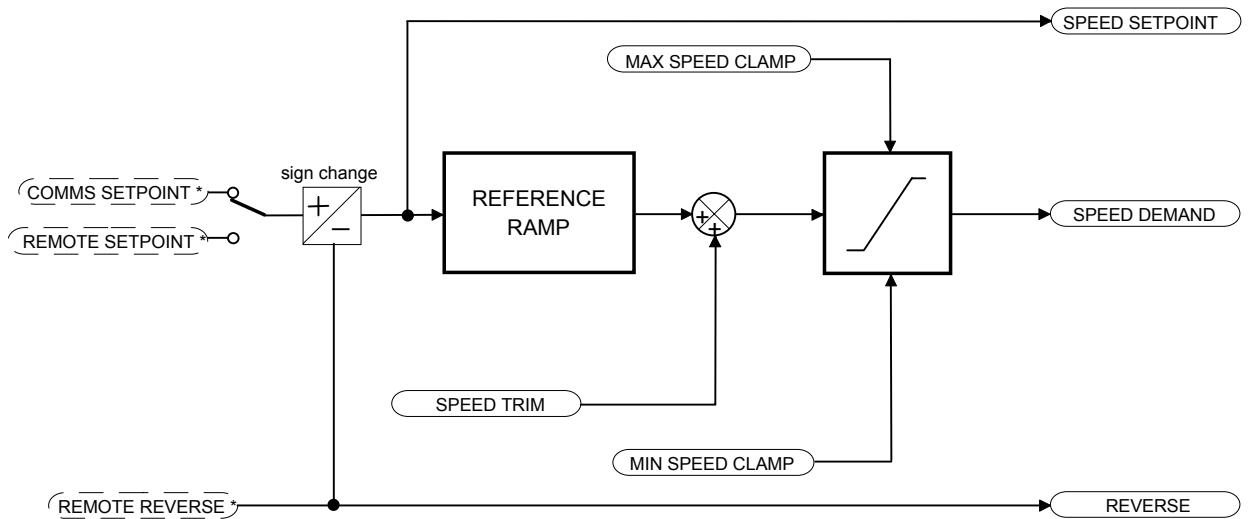

Indicates the Operator Station setpoint. It is always a positive quantity; saved on power down. Direction is taken from LOCAL REVERSE.

LOCAL REVERSE*Range: FALSE / TRUE*

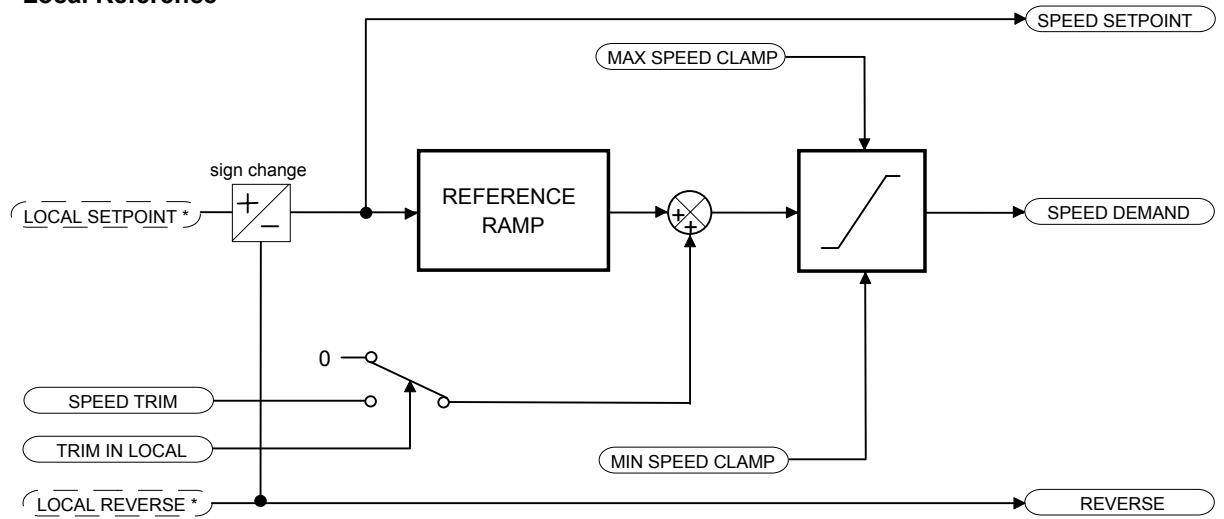

Indicates demanded direction in Local Reference mode, saved on power down.

COMMS SETPOINT*Range: —.xx %*

This setpoint is the target reference that the Inverter will ramp to in Remote Reference Comms mode (not including trim). The direction is always positive, i.e. forward.

Functional Description**Remote Reference**

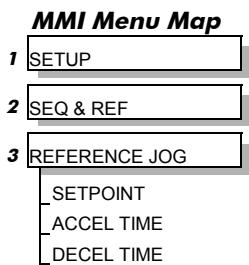

- * Set only from Comms using tag 269 (readable as tag 770 in block diagram)
- REMOTE SETPOINT if Remote Reference Terminal mode
- COMMS SETPOINT if Remote Reference Comms mode
- (Mode is selectable in COMMS CONTROL block)

Local Reference

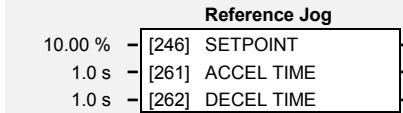

- * Set only from the Operator Station

1-90 Programming Your Application

REFERENCE JOG

This block holds all the parameters that concern the Jog functionality on the Inverter.

Parameter Descriptions

SETPOINT

Range: -100.00 to 100.00 %

The setpoint is the target reference that the Inverter will ramp to.

ACCEL TIME

Range: 0.0 to 3000.0 s

The time that the Inverter will take to ramp the jog setpoint from 0.00% to 100.00%.

DECCEL TIME

Range: 0.0 to 3000.0 s

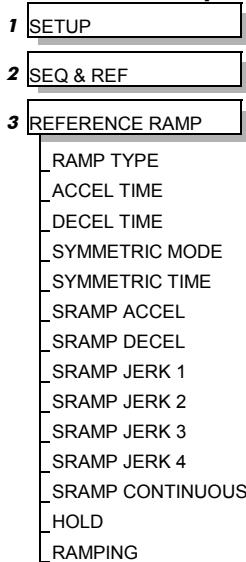

The time that the Inverter will take to ramp the jog setpoint from 100.00% to 0.00%.

Functional Description

The REFERENCE JOG function block is used to configure the action of the Inverter when used in jog mode. The various operating modes are described in more detail in the Installation Product Manual, Chapter 4: "Operating the Inverter" - The Start/Stop Mode Explained.

REFERENCE RAMP

MMI Menu Map

This function block forms part of the reference generation. It provides the facility to control the rate at which the Inverter will respond to a changing setpoint demand.

Reference Ramp

	RAMPING	[698]	FALSE
LINEAR	[244]	RAMP TYPE	
** 10.0 s	[258]	ACCEL TIME	
** 10.0 s	[259]	DECCEL TIME	
FALSE	[268]	SYMMETRIC MODE	
** 10.0 s	[267]	SYMMETRIC TIME	
10.00 /s^2	[692]	SRAMP ACCEL	
10.00 /s^2	[693]	SRAMP DECEL	
10.00 /s^3	[694]	SRAMP JERK 1	
10.00 /s^3	[695]	SRAMP JERK 2	
10.00 /s^3	[696]	SRAMP JERK 3	
10.00 /s^3	[697]	SRAMP JERK 4	
TRUE	[691]	SRAMP CONTINUOUS	
FALSE	[260]	HOLD	

Parameter Descriptions

RAMP TYPE

Range: Enumerated - see below

Select the ramp type:

Enumerated Value : Ramp Type

0 : LINEAR
1 : S

ACCEL TIME

Range: 0.0 to 3000.0 s

The time that the Inverter will take to ramp the setpoint from 0.00% to 100.00%.

DECCEL TIME

Range: 0.0 to 3000.0 s

The time that the Inverter will take to ramp the setpoint from 100.00% to 0.00%.

SYMETRIC MODE

Range: FALSE / TRUE

Select whether to use the ACCEL TIME and DECEL TIME pair of ramp rates, or to use the SYMETRIC RATE parameter to define the ramp rate for the Inverter.

SYMETRIC TIME

Range: 0.0 to 3000.0 s

The time that the Inverter will take to ramp from 0.00% to 100.00% and from 100.00% to 0.00% when SYMETRIC MODE is TRUE.

SRAMP ACCEL

Range: 0.00 to 100.00 /s²

Sets the acceleration rate in units of percent per second², i.e. if the full speed of the machine is 1.25m/s then the acceleration will be:

$$1.25 \times 75.00\% = 0.9375\text{m/s}^2$$

SRAMP DECEL

Range: 0.00 to 100.00 /s²

This functions in the same way as SRAMP ACCEL above.

SRAMP JERK 1

Range: 0.00 to 100.00 /s³

Rate of change of acceleration for the first segment of the curve in units per second³, i.e. if the full speed of the machine is 1.25m/s then the acceleration will be:

$$1.25 \times 50.00\% = 0.625\text{m/s}^3$$

SRAMP JERK 2

Range: 0.00 to 100.00 /s³

Rate of change of acceleration in units of percent per second³ for segment 2.

SRAMP JERK 3

Range: 0.00 to 100.00 /s³

Rate of change of acceleration in units of percent per second³ for segment 3.

SRAMP JERK 4

Range: 0.00 to 100.00 /s³

Rate of change of acceleration in units of percent per second³ for segment 4.

SRAMP CONTINUOUS

Range: FALSE / TRUE

When TRUE, and S ramp is selected in RAMP TYPE, forces a smooth transition if the speed setpoint is changed when ramping. The curve is controlled by the SRAMP ACCEL and SRAMP JERK 1 to SRAMP JERK 4 parameters. When FALSE, there is an immediate transition from the old curve to the new curve.

RAMP HOLD

Range: FALSE / TRUE

When TRUE the output of the ramp is held at its last value.

RAMPING

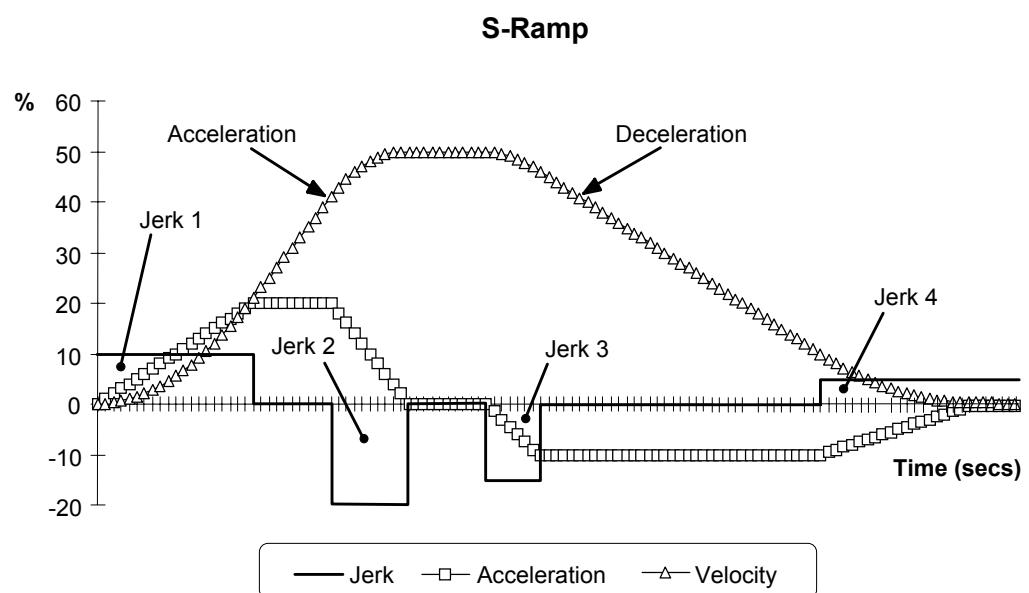

Range: FALSE / TRUE

Set TRUE when ramping.

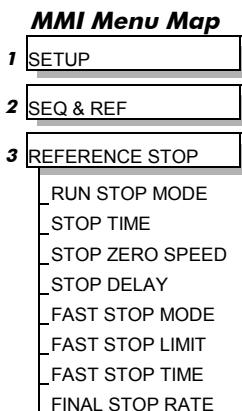

Functional Description

Installation Product Manual, Chapter 4: "Operating the Inverter" - Starting and Stopping Methods, describes the use of the system ramp.

The ramp output takes the form shown below.

REFERENCE STOP

This function block holds all the parameters concerning the stopping method of the Inverter.

The stopping methods of the Inverter are described in more detail in the Installation Product Manual, Chapter 4: "Operating the Inverter" - Starting and Stopping Methods..

Reference Stop	
RUN RAMP	[279] RUN STOP MODE
10.0 s	[263] STOP TIME
0.10 %	[266] STOP ZERO SPEED
0.500 s	[284] STOP DELAY
RAMPED	[304] FAST STOP MODE
30.0 s	[275] FAST STOP LIMIT
0.1 s	[264] FAST STOP TIME
1200 Hz/s	[126] FINAL STOP RATE

Parameter Descriptions

RUN STOP MODE

Range: Enumerated - see below

Selects stopping mode that the controller will use once the run command has been removed. The choices are:

Enumerated Value : Stopping Mode

- 0 : RUN RAMP
- 1 : COAST
- 2 : DC INJECTION
- 3 : STOP RAMP

When RUN RAMP is selected the Inverter will decelerate using the reference ramp deceleration time, provided it is non zero. When COAST is selected the motor will free-wheel. When DC INJECTION is selected the motor is stopped by applying dc current. When STOP RAMP is selected the motor will decelerate in STOP TIME.

STOP TIME

Range: 0.0 to 600.0 s

Rate at which the demand is ramped to zero after the ramp has been quenched.

STOP ZERO SPEED

Range: 0.00 to 100.00 %

Threshold for zero speed detection used by stop sequences.

STOP DELAY

Range: 0.000 to 30.000 s

Sets the time at which the Inverter holds zero speed before quenching after a normal stop or a jog stop. This may be particularly useful if a mechanical brake requires time to operate at zero speed, or for jogging a machine to position.

FAST STOP MODE

Range: Enumerated - see below

Selects stopping mode used during a fast stop, two options ramped or coast.

Enumerated Value : Stopping Mode

- 0 : RAMPED
- 1 : COAST

FAST STOP LIMIT

Range: 0.0 to 3000.0 s

Maximum time that the Inverter will try to Fast Stop, before quenching.

FAST STOP TIME

Range: 0.0 to 600.0 s

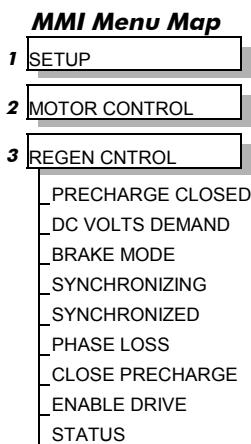

Rate at which the SPEED DEMAND is ramped to zero (see REFERENCE function block)

FINAL STOP RATE

Range: 12 to 4800 Hz/s

Rate at which any internally generated setpoint trims are removed. For example, the trim due to the slip compensation block.

REGEN CONTROL

Designed for 4Q Regen Control Mode.

This function block is used to setup, sequence and monitor the operation of the drive when used in 4Q Regen Control Mode.

Regen Control	
SYNCHRONIZING	[1641]
SYNCHRONIZED	[1642]
PHASE LOSS	[1643]
CLOSE PRECHARGE	[1644]
ENABLE DRIVE	[1645]
STATUS	[1646]
TRUE	SUPPLY FREQ LOW
720V	[1633] PRECHARGE CLOSED
FALSE	[1634] DC VOLTS DEMAND
	[1678] BRAKE MODE

Parameter Descriptions

PRECHARGE CLOSED

Range: FALSE / TRUE

This parameter is used to indicate the external precharge contactor is closed, i.e. the external precharge resistor is no longer in circuit.

DC VOLTS DEMAND

Range: 0 to 1000V

Use this to set the demanded dc link volts for the common dc bus. It must be set higher than the peak of the mains supply, but lower than the overvolts (820V on 400V products, 410V on 230V products).

BRAKE MODE

Range: FALSE / TRUE

Setting this parameter True allows the drive to generate energy into the mains in common dc link systems. The regeneration occurs when the dc link is higher than the DC VOLTS DEMAND level. In this mode the drive will not draw energy from the mains. The drive acts purely as a braking unit.

SYNCHRONIZING

Range: FALSE / TRUE

This diagnostic reads True during the mains synchronisation period. This occurs when the drive is first run in 4Q Regen Control Mode. This synchronising period lasts for 100ms.

SYNCHRONIZED

Range: FALSE / TRUE

This diagnostic reads True when mains synchronisation has been successfully completed.

PHASE LOSS

Range: FALSE / TRUE

This diagnostic reads True if the drive suspects there is a missing input phase from the mains supply.

CLOSE PRECHARGE

Range: FALSE / TRUE

This diagnostic controls the operation of the external precharge contactor required by the 4Q Regen Control Mode.

ENABLE DRIVE

Range: Enumerated - see below

This diagnostic is used to enable drives on a common dc link system supplied by a drive using the 4Q Regen Control Mode. The diagnostic reads True if mains synchronisation has been successful and the drive is Healthy.

STATUS*Range: Enumerated - see below*

This diagnostic indicates the status of operation of the drive.

Enumerated Value : Status

- 0 : INACTIVE
- 1 : SYNCHRONIZING
- 2 : SYNCHRONIZED
- 3 : SUPPLY FREQ HIGH
- 4 : SUPPLY FREQ LOW
- 5 : SYNCH FAILED

INACTIVE : Indicates when the 4Q drive is not running

SYNCHRONIZING : Indicates during mains synchronisation period (first 100ms after Run command)

SYNCHRONIZED : Indicates successful synchronisation is complete

SUPPLY FREQ HIGH : Indicates 4Q drive output frequency is greater than 70Hz. This is a fault condition

SUPPLY FREQ LOW : Indicates the 4Q drive output frequency is less than 40Hz. This is a fault condition

SYNCH FAILED : Indicates the 4Q drive has failed to synchronise on to the mains supply. This is a fault condition

SEQUENCING LOGIC

MMI Menu Map

1	SETUP
2	SEQ & REF
3	SEQUENCING LOGIC
	START DELAY
	RUN FORWARD
	RUN REVERSE
	NOT STOP
	JOG
	CONTACTOR CLOSED
	DRIVE ENABLE
	NOT FAST STOP
	NOT COAST STOP
	REMOTE REVERSE
	REM TRIP RESET
	TRIP RST BY RUN
	POWER UP START
	TRIPPED
	RUNNING
	JOGGING
	STOPPING
	OUTPUT CONTACTOR
	SWITCH ON ENABLE
	SWITCHED ON
	READY
	SYSTEM RESET
	SEQUENCER STATE
	REMOTE REV OUT
	HEALTHY
	FAN RUNNING

This function block contains all the parameters relating to the sequencing (start and stop) of the Inverter.

Before the Inverter will respond to the RUN FWD, RUN REV or JOG parameters (cause the Inverter to run or jog), the parameters DRIVE ENABLE, NOT FAST STOP and NOT COAST STOP need to be set to TRUE. In addition, the Inverter needs to be healthy (HEALTHY is TRUE). The Inverter will only respond to RUN FWD, RUN REV and JOG if the Inverter is in the Remote Sequencing mode.

If RUN FWD and RUN REV are TRUE, both are ignored and the Inverter will stop.

Sequencing Logic	
-	TRIPPED [289] FALSE
-	RUNNING [285] FALSE
-	JOGGING [302] FALSE
-	STOPPING [303] FALSE
-	OUTPUT CONTACTOR [286] FALSE
-	SWITCH ON ENABLE [288] FALSE
-	SWITCHED ON [306] FALSE
-	READY [287] FALSE
-	SYSTEM RESET [305] FALSE
-	SEQUENCER STATE [301] START DISABLED
-	REMOTE REV OUT [296] FALSE
-	HEALTHY [274] TRUE
-	FAN RUNNING [620] FALSE
0.000s	[1686] START DELAY
FALSE	[291] RUN FORWARD
FALSE	[292] RUN REVERSE
FALSE	[293] NOT STOP
FALSE	[280] JOG
TRUE	[1235] CONTACTOR CLOSED
TRUE	[276] DRIVE ENABLE
TRUE	[277] NOT FAST STOP
TRUE	[278] NOT COAST STOP
FALSE	[294] REMOTE REVERSE
FALSE	[282] REM TRIP RESET
TRUE	[290] TRIP RST BY RUN
FALSE	[283] POWER UP START

Parameter Descriptions

START DELAY

Range: 0.000 to 30.000s

Delays the action of "ramping to setpoint" from the Run command. This can allow a period for motor flux to establish before the ramp to setpoint.

RUN FWD

Range: FALSE / TRUE

Setting this parameter to TRUE causes the Inverter to run in the forward direction.

RUN REV

Range: FALSE / TRUE

Setting this parameter to TRUE causes the Inverter to run in the reverse direction.

NOT STOP

Range: FALSE / TRUE

Setting this parameter TRUE will latch the RUN FWD or RUN REV commands. Once latched, they can be reset to FALSE and the Inverter will continue to run. Setting NOT STOP to FALSE causes the run commands to be unlatched.

JOG

Range: FALSE / TRUE

Setting this parameter TRUE causes the Inverter to run at the speed set by JOG SETPOINT (refer to the REFERENCE JOG function block). Once jogging, setting JOG to FALSE causes the Inverter to ramp to zero.

CONTACTOR CLOSED

Range: FALSE / TRUE

Feedback used to indicate that the external contactor has been closed. It must be TRUE for the sequencer to proceed from the SWITCHED ON state to the READY STATE, refer to SEQUENCER STATE.

DRIVE ENABLE

Range: FALSE / TRUE

This provides a means of electronically inhibiting Inverter operation. Whilst running, setting this parameter to FALSE disables the Inverter operation and causes the motor to coast.

NOT FAST STOP

Range: FALSE / TRUE

Whilst running or jogging, setting this parameter to FALSE causes the Inverter to ramp to zero. The rate is set by FAST STOP RATE in the STOP function block. The action of setting NOT FAST STOP to TRUE is latched. The Inverter cannot be restarted until fast stop is completed.

NOT COAST STOP*Range: FALSE / TRUE*

Setting this parameter to FALSE disables the Inverter operation and causes the motor to coast. The action of setting this parameter to TRUE is latched. The Inverter can not be restarted until the coast stop is completed.

A detailed description of the sequencer states, as indicated by the MAIN SEQ STATE parameter, is described in Chapter 4. The sequence logic is described in the Installation Product Manual, Chapter 4: "Operating the Inverter" - Selecting Local or Remote Control.

REMOTE REVERSE*Range: FALSE / TRUE*

For remote setpoints, setting this parameter TRUE inverts the demanded direction of motor rotation.

REM TRIP RESET*Range: FALSE / TRUE*

On a transition to TRUE, this input clears latched trips.

TRIP RST BY RUN*Range: FALSE / TRUE*

This allows the rising edge of run command to clear latched trips.

POWER UP START*Range: FALSE / TRUE*

If TRUE, this allows the Inverter to go directly to run mode if in remote and a run command is present. If FALSE, a low to high transition of the run command is required.

TRIPPED*Range: FALSE / TRUE*

Indicates that there is a latched trip present.

RUNNING*Range: FALSE / TRUE*

Indicates that the Inverter is in the enabled state.

JOGGING*Range: FALSE / TRUE*

Indicates that the Inverter is in the JOG mode.

STOPPING*Range: FALSE / TRUE*

Indicates that the Inverter is stopping.

OUTPUT CONTACTOR*Range: FALSE / TRUE*

Output to be used to drive an external contactor in the motor output. This contactor is normally closed unless a Trip condition has occurred or the Inverter goes into the re-configuration mode.

SWITCH ON ENABLE*Range: FALSE / TRUE*

Sometimes referred to as READY TO SWITCH ON, this parameter indicates that the Inverter will accept a run command.

SWITCHED ON*Range: FALSE / TRUE*

Run accepted. Waiting for CONTACTOR CLOSED and deflux to be completed

READY*Range: FALSE / TRUE*

Indicates that the Inverter's power stack is operable and the Inverter will run if enabled.

SYSTEM RESET*Range: FALSE / TRUE*

TRUE for a single block diagram execution cycle after the Inverter enters either RUN or JOG mode.

1-98 Programming Your Application

SEQUENCER STATE

Range: Enumerated - see below

This parameter indicates the current sequencing state:

Enumerated Value : State

- 0 : START DISABLED
- 1 : START ENABLED
- 2 : SWITCHED ON
- 3 : READY
- 4 : ENABLED
- 5 : F-STOP ACTIVE
- 6 : TRIP ACTIVE
- 7 : TRIPPED

Refer to Chapter 4: "Sequencing Logic States".

REMOTE REV OUT

Range: FALSE / TRUE

This parameter indicates the current state of remote direction and RUN REV. Note - this is the demanded direction, not the actual direction.

HEALTHY

Range: FALSE / TRUE

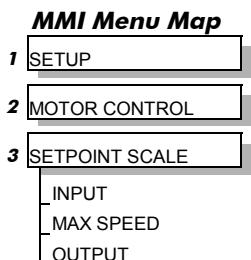

Set FALSE when the Inverter trips, and set TRUE when the run command is removed.

FAN RUNNING

Range: FALSE / TRUE

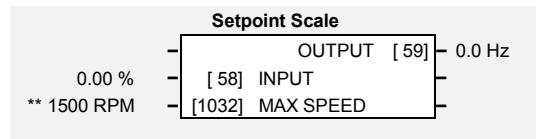

This can be used to control the running of externally supplied fans. True when the drive is running, goes FALSE 60 seconds after the drive has stopped.

SETPOINT SCALE

Designed for all Motor Control Modes.

This function block simply converts the way the setpoint is expressed from being a percentage of the MAX SPEED to an absolute frequency in electrical Hertz.

Parameter Descriptions

INPUT

Range: -300.00 to 300.00 %

The setpoint delivered by the re-wired function block portion of the Inverter's application.

MAX SPEED

Range: 0 to 32000 rpm

The physical motor speed equivalent to a setpoint demand of 100.00%. Note that although INPUT may be set between $\pm 300\%$, the input value is clamped before being used to $\pm 110\%$. Hence, the greatest input speed which can be demanded is $\pm 110\%$ of MAX SPEED.

Refer to Chapter 2: "Parameter Specification" - Frequency Dependent Defaults

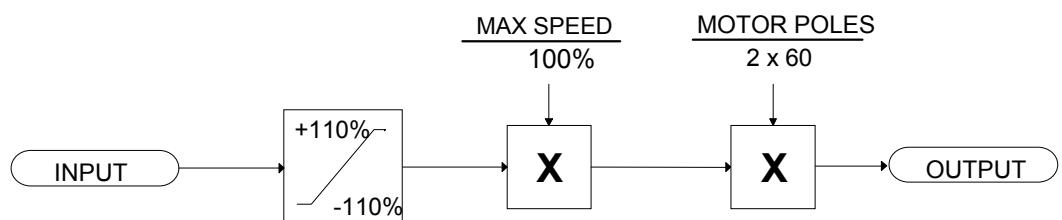

OUTPUT

Range: —.x %

$$\text{Output} = \frac{\text{max speed} \times \text{input}}{100\%} \times \frac{\text{number of motor poles}}{2} \times \frac{1}{60}$$

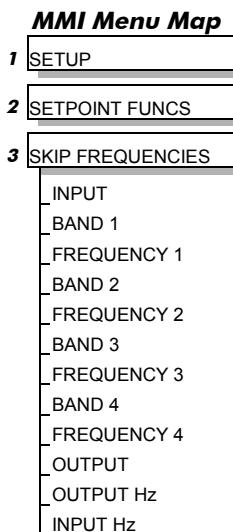

Functional Description

The setpoint scale block changes the format in which the setpoint is expressed. The function blocks on the input side of this block process the setpoint as a percentage of maximum RPM. The function blocks on the output side of this block process the setpoint as an absolute frequency of rotation of the electric field in Hertz.

1-100 Programming Your Application

SKIP FREQUENCIES

This function block may be used to prevent the Inverter operating at frequencies that cause mechanical resonance in the load.

Skip Frequencies

OUTPUT [346]	0.00 %
OUTPUT HZ [363]	0.0 Hz
INPUT HZ [362]	0.0 Hz
0.00 %	[340] INPUT
0.0 Hz	[341] BAND 1
0.0 Hz	[342] FREQUENCY 1
0.0 Hz	[680] BAND 2
0.0 Hz	[343] FREQUENCY 2
0.0 Hz	[681] BAND 3
0.0 Hz	[344] FREQUENCY 3
0.0 Hz	[682] BAND 4
0.0 Hz	[345] FREQUENCY 4

Parameter Descriptions

INPUT

The value of the block input in %.

Range: -300.00 to 300.00 %

BAND 1

The width of each skip band in Hz.

Range: 0.0 to 480.0 Hz

FREQUENCY 1

This parameter contains the centre frequency of each skip band in Hz.

Range: 0.0 to 480.0 Hz

BAND 2

The width of each skip band in Hz.

Range: 0.0 to 480.0 Hz

FREQUENCY 2

This parameter contains the centre frequency of each skip band in Hz.

Range: 0.0 to 480.0 Hz

BAND 3

The width of each skip band in Hz.

Range: 0.0 to 480.0 Hz

FREQUENCY 3

This parameter contains the centre frequency of each skip band in Hz.

Range: 0.0 to 480.0 Hz

BAND 4

The width of each skip band in Hz.

Range: 0.0 to 480.0 Hz

FREQUENCY 4

This parameter contains the centre frequency of each skip band in Hz.

Range: 0.0 to 480.0 Hz

OUTPUT

Range: —.xx %

Diagnostic on the output of the function block in %

OUTPUT HZ

Range: —.x Hz

Diagnostic on the output of the function block in Hz

INPUT HZ

Range: —.x Hz

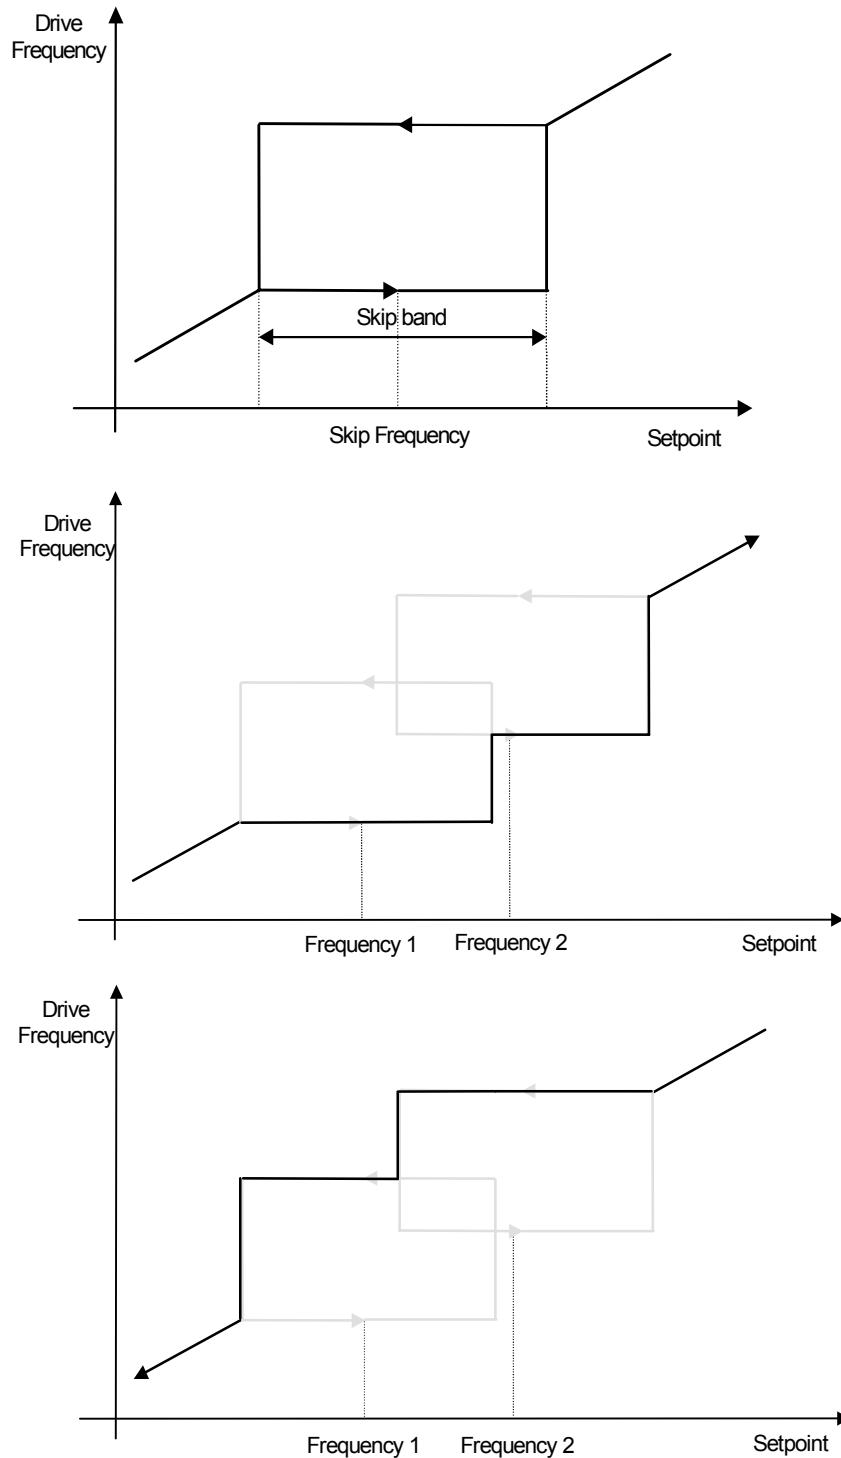

Diagnostic on the input of the function block in Hz

Functional Description

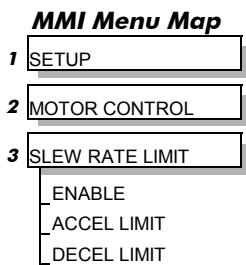

Four programmable skip frequencies are available to avoid resonances within the mechanical system. Enter the value of frequency that causes the resonance using the “FREQUENCY” parameter and then programme the width of the skip band using its “BAND” parameter. The Inverter will then avoid sustained operation within the forbidden band as shown in the diagram. The skip frequencies are symmetrical and thus work in forward and reverse.

Note: Setting the FREQUENCY to 0 disables the corresponding band.
Setting the BAND to 0 causes the value of BAND 1 to be used for this band.

The behaviour of this function block is illustrated below.

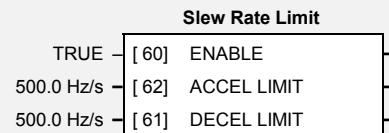

SLEW RATE LIMIT

Designed for all Motor Control Modes.

This function block prevents over-current and over-voltage faults occurring due to a rapidly changing setpoint.

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

When this parameter is FALSE, this function block is disabled and the setpoint is unaffected by this function block.

ACCEL LIMIT

Range: 1.0 to 1200.0 Hz/s

The maximum rate at which the setpoint may accelerate away from zero.

DECCEL LIMIT

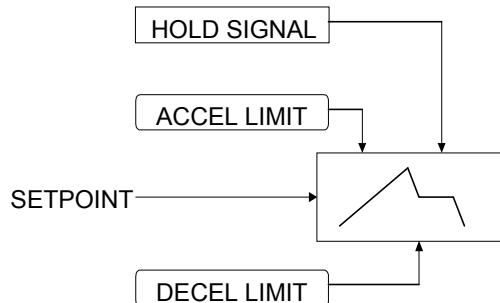

Range: 1.0 to 1200.0 Hz/s

The maximum rate at which the setpoint may decelerate towards zero.

Functional Description

The SLEW RATE LIMIT block obtains the setpoint from the output of the application, correctly scaled by the SETPOINT SCALE block. The rate of change limits are applied and the setpoint is then passed on for further processing.

When the braking block determines that the internal dc link voltage is too high it issues a Hold signal. This causes the SLEW RATE LIMIT block to hold the setpoint at its current value. This typically lasts for only 1ms, time for the excess energy to be dumped into the braking resistor.

Note: If the drive is part of a common DC link/bus system set the ENABLE parameter to FALSE. This disables ramp-hold during deceleration on high link volts feature.

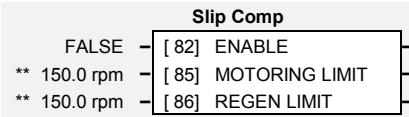

SLIP COMP

MMI Menu Map

- 1 SETUP
- 2 MOTOR CONTROL
- 3 SLIP COMP
 - ENABLE
 - MOTORING LIMIT
 - REGEN LIMIT

Designed for VOLTS/Hz motor Control Mode.

The slip compensation function block allows the Inverter to maintain motor speed in the presence of load disturbances.

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

For the slip compensation to be operational this must be TRUE.

MOTORING LIMIT

Range: 0.0 to 600.0 rpm

The maximum trim that will be produced by the slip compensation block when the motor is driving the load (motoring).

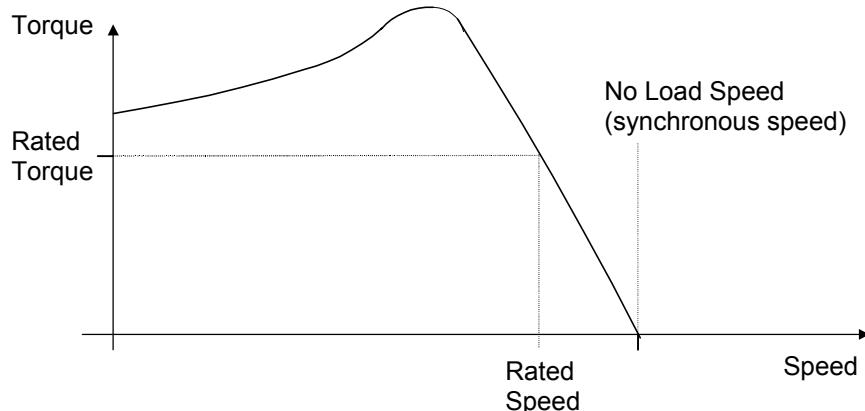

REGEN LIMIT

Range: 0.0 to 600.0 rpm

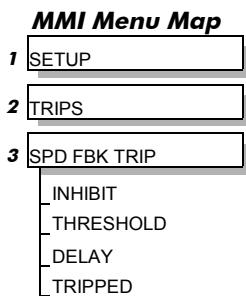

The maximum trim that will be produced by the slip compensation block when the motor is being driven by the load, (regenerating).

Functional Description

Based on the rated speed, the no load speed and the rated load of the motor, the slip compensation block adjusts the demand frequency to compensate for any speed slippage resulting from the load.

SPD FBK TRIP

Designed for CLOSED-LOOP VEC Motor Control Mode.

The speed feed back trip operates by looking at speed error and comparing it against THRESHOLD.

If the error exceeds this threshold for a period greater than DELAY, then a trip is triggered. The trip is only active while the drive is operating in Closed-Loop Vector Control and not in Autotune. When using the drive in torque control, this trip should be disabled to prevent nuisance tripping by setting INHIBIT to TRUE.

Torque control is defined as operating in torque or current limit, or if the TORQ DMD ISOLATE parameter in the SPEED LOOP function block is TRUE.

Parameter Descriptions

INHIBIT

Range: FALSE / TRUE

Set this parameter to TRUE to disable the speed feedback trip.

THRESHOLD

Range: 0.00 to 300.00 %

Sets a threshold below which the trip will not operate. The value of THRESHOLD is compared to the value of SPEED ERROR (from the SPEED LOOP function block).

DELAY

Range: 0.00 to 300.00 s

Sets the time the trip must be present for before a trip is triggered.

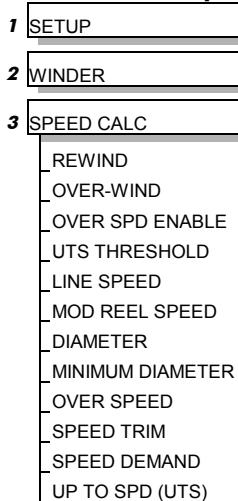

TRIPPED

Range: FALSE / TRUE

This is a diagnostic output indicating the current state of the speed feedback trip.

SPEED CALC

MMI Menu Map

In this function block line speed is summed with the over speed input (only if in open-loop mode) and the closed loop trim (for closed loop winders) from the PID output SPEED TRIM. The combined speed demand is divided by the diameter to produce the SPEED DEMAND to the drive.

Refer to Macro 4.

Speed Calc		
-	SPEED DEMAND [784]	0.00 %
-	UP TO SPD (UTS) [785]	TRUE
TRUE	[774] REWIND	
TRUE	[775] OVER-WIND	
FALSE	[776] OVER SPD ENABLE	
5.00 %	[777] UTS THRESHOLD	
0.00 %	[778] LINE SPEED	
0.00 %	[779] MOD REEL SPEED	
10.00 %	[780] DIAMETER	
10.00 %	[781] MINIMUM DIAMETER	
10.00 %	[782] OVER SPEED	
0.00 %	[783] SPEED TRIM	

Parameter Descriptions

REWIND

Range: FALSE / TRUE

The Rewind mode is selected when TRUE.

OVER-WIND

Range: FALSE / TRUE

The Overwind mode is selected when TRUE.

OVER SPD ENABLE

Range: FALSE / TRUE

When TRUE, Over Speed is enabled which saturates the speed loop.

UTS THRESHOLD

Range: 0.00 to 110.00 %

Threshold level which defines the state of UP TO SPD (UTS).

LINE SPEED

Range: 0.00 to 110.00 %

Actual line speed (from the DIAMETER CALC function block).

MOD REEL SPEED

Range: 0.00 to 110.00 %

The absolute value of the WINDER SPEED (from the DIAMETER CALC function block).

DIAMETER

Range: 0.00 to 110.00 %

The diameter input (from the DIAMETER CALC function block).

MINIMUM DIAMETER

Range: 0.00 to 120.00 %

The minimum diameter input (from the DIAMETER CALC function block).

OVER SPEED

Range: -100.00 to 120.00 %

A value of over speed which, when added to the calculated speed, will saturate the speed loop.

1-106 Programming Your Application

SPEED TRIM

Range: -100.00 to 110.00 %

An additional speed loop input.

SPEED DEMAND

Range: -..00 %

The speed demand output.

UP TO SPD (UTS)

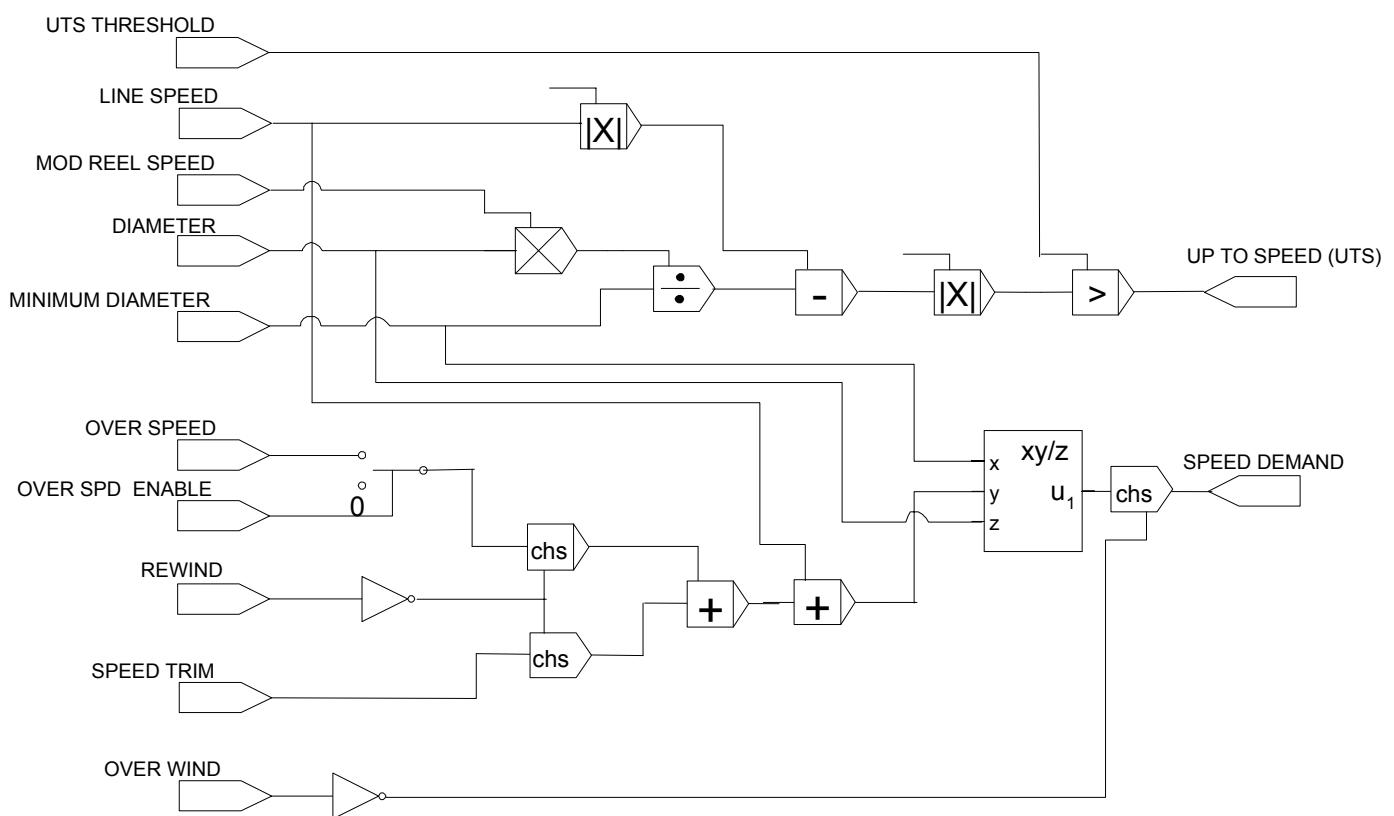

Range: FALSE / TRUE

The up-to-speed detector compares LINE SPEED with MOD REEL SPEED multiplied by DIAMETER. When they are the same, within the UTS THRESHOLD, then UP TO SPD (UTS) is TRUE.

Functional Description

The speed demand calculator takes its reference from the line speed setpoint.

The polarity is determined by OVER-WIND , this is positive for Over (OVER-WIND = TRUE).

SPEED LOOP

MMI Menu Map	
1	SETUP
2	MOTOR CONTROL
3	SPEED LOOP

-	TORQ DMD ISOLATE
-	TOTAL SPEED RPM
-	TOTAL SPEED %
-	SPEED ERROR
-	TORQUE DEMAND
-	DIRECT INPUT
-	PHASE INPUT

Designed for SENSORLESS VEC and CLOSED-LOOP VEC Motor Control Modes.

This function block controls the speed of the motor by comparing the actual speed to the demanded speed, and applying more or less torque in response to the error.

Fixed Inputs and Outputs

Speed Demand

This is connected to the output of the SETPOINT SCALE function block.

Speed Feedback

The speed feedback is derived from the encoder when the Control Mode is configured as CLOSED-LOOP VEC. When configured as SENSORLESS VEC, the speed feedback is calculated from the voltages and currents in the motor.

Torque Demand

The output of the SPEED LOOP function block is a torque demand. This torque demand is passed on to the TORQUE LIMIT function block, which causes the torque to be generated in the motor.

Parameter Descriptions

SPEED PROP GAIN

Range: 0.00 to 300.00

Sets the proportional gain of the loop.

Speed error (revolutions per second) x proportional gain = torque percent.

SPEED INT TIME

Range: 1 to 15000 ms

This is the integral time constant of the speed loop. A speed error which causes the proportional term to produce a torque demand T, will cause the integral term to also ramp up to a torque demand T after a time equal to "speed int time".

INT DEFEAT

Range: FALSE / TRUE

When TRUE, the integral term does not operate.

SPEED INT PRESET

Range: -500.00 to 500.00 %

The integral term will be preset to this value when the drive starts.

SPEED DMD FILTER

Range: 0.0 to 14.0 ms

The speed demand is filtered to reduce ripple. The filter is first order with time constant equal to the value of this parameter.

SPEED FBK FILTER

Range: 0.0 to 15.0 ms

The speed feedback is filtered to reduce ripple, such as that caused by low line count encoders. The filter is first order with time constant equal to the value of this parameter.

AUX TORQUE DMD

Range: -300.00 to 300.00 %

When the drive is operating in speed control mode, the value of this parameter is added on to the torque demand produced by the speed loop PI. When the drive is operating in torque control mode (i.e. "torque demand isolate is TRUE) the speed loop PI does not operate, and the torque demand becomes the sum of this parameter plus the DIRECT INPUT (if selected).

ADAPTIVE THRESH

Range: 0.00 to 10.00 %

This function is not implemented.

Speed Loop	
TOTAL SPD DMD RPM	[1203] 0.00 RPM
TOTAL SPD DMD %	[1206] 0.00 %

1-108 Programming Your Application

ADAPTIVE P-GAIN

Range: 0.00 to 300.00

This function is not implemented.

DIRECT IP SELECT

Range: See below

The direct input to the speed loop is an analog input which is sampled synchronously with the speed loop. This ensures that the speed loop always has the most up-to-date value of the input, allowing it to respond faster. Any one of the four analog inputs can be selected as the direct input. If NONE is selected, the input is set to zero. When not in use, it should be disabled by selecting NONE.

- 0 : NONE
- 1 : ANIN 1
- 2 : ANIN 2
- 3 : ANIN 3
- 4 : ANIN 4

DIRECT RATIO

Range: -10.0000 to 10.0000

The Direct Input is multiplied by this parameter.

DIRECT IP POS LIM

Range: -110.00 to 110.00 %

This limits the upper value of the Direct Input.

DIRECT IP NEG LIM

Range: -110.00 to 110.00 %

This limits the lower value of the Direct Input.

SPEED POS LIM

Range: -110.00 to 110.00 %

This sets the upper limit of the speed demand.

SPEED NEG LIM

Range: -110.00 to 110.00 %

This sets the lower limit of the speed demand.

TORQ DMD ISOLATE

Range: FALSE / TRUE

Selects between Speed Control mode and Torque Control mode. When TRUE, (Torque Control mode) the torque demand output from the speed loop block is the sum of the Direct Input plus the AUX TORQUE DMD parameter.

TOTAL SPD DMD RPM

Range: —.xx rpm

This diagnostic shows the final values of the speed demand obtained after summing all sources. This is the value which is presented to the speed loop.

TOTAL SPD DMD %

Range: —.00 %

This diagnostic shows the final values of the speed demand obtained after summing all sources. This is the value which is presented to the speed loop.

SPEED ERROR

Range: —.00 %

Shows the difference between the demanded speed and the actual speed.

TORQUE DEMAND

Range: —.00 %

Shows the demanded motor torque as a percentage of rated motor torque.

DIRECT INPUT

Range: —.00 %

Shows the value of the Direct Input, after scaling and clamping.

PHASE INPUT

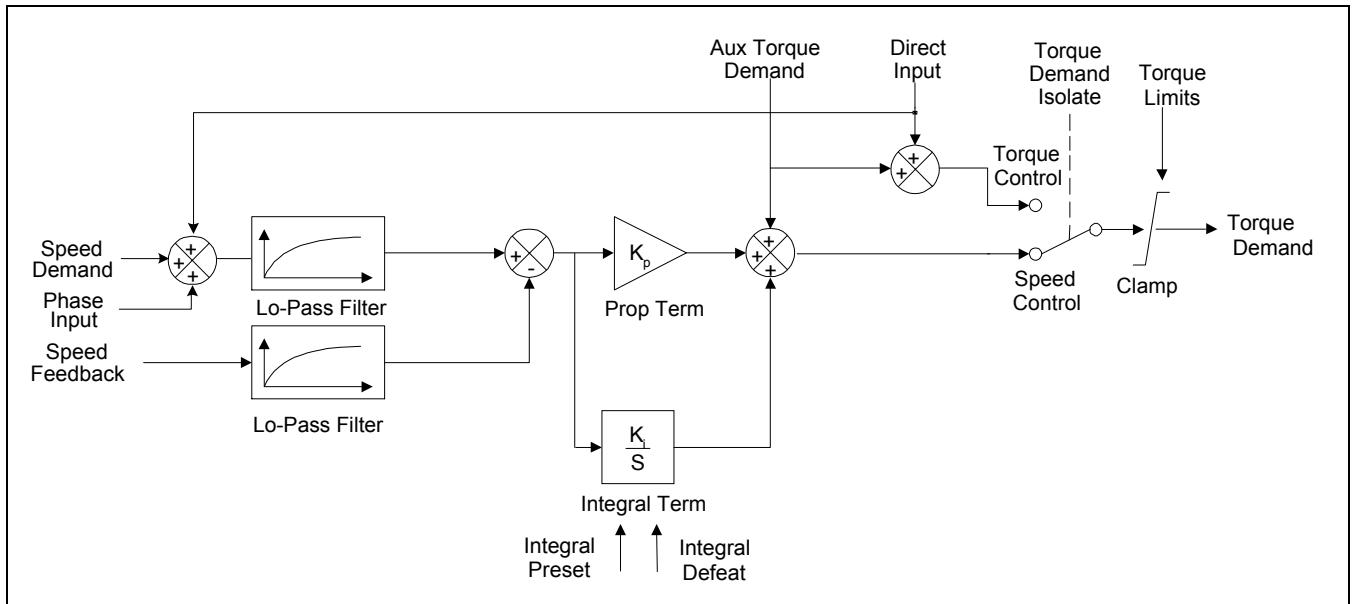

Range: —.00 %

Shows the value of the Phase PID Output connected internally.

Functional Description

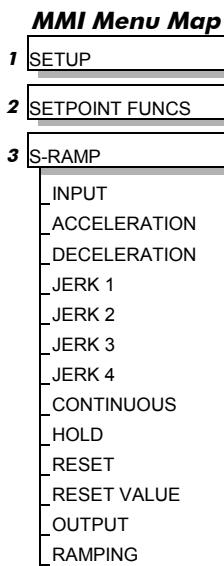

The speed error (speed demand minus speed feedback) is calculated and processed via a proportional + integral (PI) controller. The output of the PI controller is a torque demand, which is passed directly to the torque control block.

The speed demand is derived from the Setpoint Scale block. The speed feedback is derived from the encoder when the drive is in CLOSED-LOOP VEC mode. This mode gives the best control, as the feedback is fast and accurate. When the drive is in SENSORLESS VEC mode, the speed feedback is calculated from the voltages and currents in the motor.

1-110 Programming Your Application

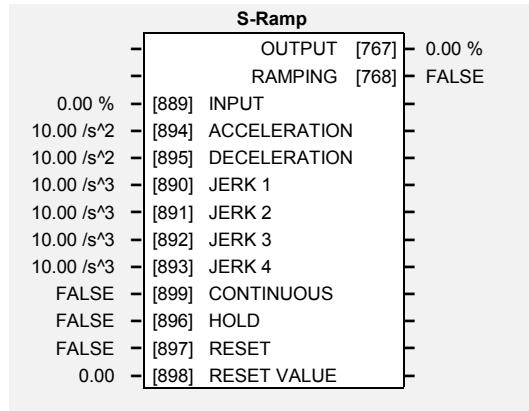

S-RAMP

This function block limits the rate of change of an input by limiting the acceleration and jerk.

Refer to REFERENCE RAMP, page 1-91.

An example acceleration graph for a velocity 60 %/s maximum, acceleration of 20 %/s² and a jerk of 10 %/s³ is shown below.

Parameter Descriptions

INPUT

Ramp input.

Range: -100.00 to 100.00 %

ACCELERATION

Sets the acceleration rate in units of percent per second², i.e. if the full speed of the machine is 1.25m/s then the acceleration will be: $1.25 \times 75.00\% = 0.9375\text{m/s}^2$

Range: 0.00 to 100.00 /s²

DECELERATION

This functions in the same way as ACCELERATION above.

Range: 0.00 to 100.00 /s²

JERK 1 to JERK 4

Rate of change of acceleration for the relevant segment of the curve, i.e. JERK 1 is for segment 1, etc.

Range: 0.00 to 100.00 /s³

CONTINUOUS

When TRUE, it forces a smooth transition if the speed point is changed when ramping. The curve is controlled by the ACCELERATION and JERK 1 to JERK 4 parameters. When FALSE, there is an immediate transition from the old curve to the new curve.

Range: FALSE / TRUE

HOLD

When TRUE, the output of the ramp is held at its last value.

Range: FALSE / TRUE

RESET

If TRUE, the output is made equal to the input.

Range: FALSE / TRUE

RESET VALUE

The value that the output is set to while RESET is TRUE.

Range: -100.00 to 100.00

OUTPUT

The ramp output.

Range: -100.00 to 100.00

RAMPING

This is set TRUE when ramping.

Range: FALSE / TRUE

Functional Description

$$\text{The time needed to stop or accelerate is: } t = \frac{V}{A} + \frac{A}{J} \text{ [Seconds]}$$

As the speed is symmetrical, the average speed is V/2 therefore the stopping / acceleration distance can be calculated:

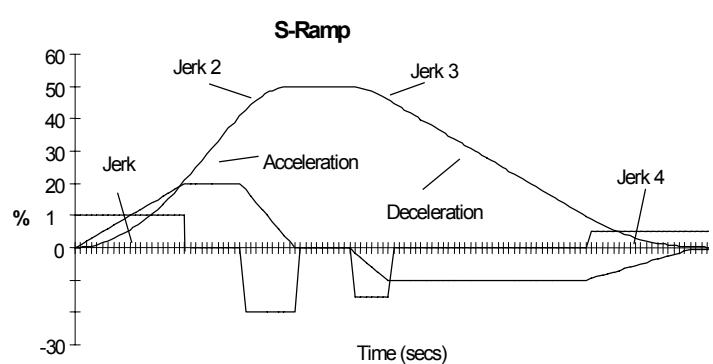

$$s = \frac{V}{2} \left[\frac{V}{A} + \frac{A}{J} \right] \text{ [Meters]}$$

V is the maximum speed the drive must reach. In % / sec.

A is the maximum allowable acceleration in %/sec².

J is the maximum allowable value for jerk, in %/sec³

Note: These only hold true if Jerk = Jerk2 for acceleration or Jerk 3 = Jerk 4 for deceleration.

STABILISATION

MMI Menu Map

- 1 SETUP
 - 2 MOTOR CONTROL
 - 3 STABILISATION
- ENABLE

Designed for VOLTS/Hz motor Control Mode.

Stabilisation
TRUE - [128] ENABLE -

Enabling this function reduces the problem of unstable running in induction motors. This can be experienced at approximately half full speed, and under low load conditions.

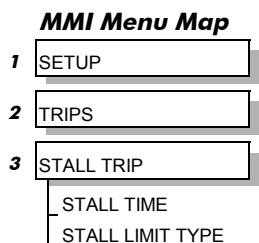

Parameter Descriptions

ENABLE

Range: FALSE / TRUE

Enables (or disables) the stabilisation function.

STALL TRIP

The function block protects the motor from damage that may be caused by continuous operation beyond specification.

STALL TRIP	
480.0 s	[241] STALL TIME
TORQUE	[1208] STALL LIMIT TYPE

Parameter Descriptions

STALL TIME

Range: 0.1 to 3000.0 s

The time after which a stall condition will cause a trip.

STALL LIMIT TYPE

Range:

This parameter determines whether the stall trip operates on motor torque or motor current.

Enumerated Value : Stall Limit Type

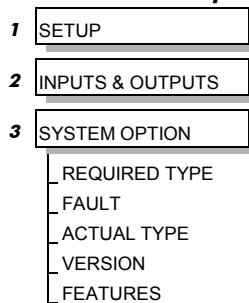

- 0 : TORQUE
- 1 : CURRENT

Functional Description

If STALL LIMIT TYPE is set to TORQUE and the estimated load exceeds the active TORQUE LIMIT (refer to the TORQUE LIMIT function block) for a time greater than STALL TIME then the stall trip will become active. The timer is reset whenever the estimated load is less than the active Torque Limit.

Similarly, if the STALL LIMIT TYPE is set to CURRENT and the measured current exceeds the active Current limit (i.e. the drive is in current limit) for a time greater than STALL TIME then the stall trip will become active. The timer is reset whenever the measured current is less than the active Current Limit.

Refer to the Installation Product Manual, Chapter 6 for a description of the trips supported by the Inverter.

MMI Menu Map**SYSTEM OPTION**

This function block is used to select the System Board option required.

If a System Board is fitted, the block reports the type, version and working status of the option.

If a System Board is present when defaults are loaded, the REQUIRED TYPE parameter is automatically set.

System Option	
FAULT [1293]	NONE
ACTUAL TYPE [1294]	NONE
VERSION [1295]	0000
FEATURES [1498]	0000
[1292] REQUIRED TYPE	

Parameter Descriptions**REQUIRED TYPE**

Range: Enumerated - see below

Selects the type of System Board option required to be fitted for the application to operate correctly.

Enumerated Value : Option Type

- 0 : NONE
- 1 : DUAL ENCODER
- 2 : TYPE 2
- 3 : TYPE 3
- 4 : TYPE 4
- 5 : TYPE 5
- 6 : TYPE 6
- 7 : TYPE 7
- 8 : TYPE 8

FAULT

Range: Enumerated - see below

The fault state of the System Board Option.

Enumerated Value : Fault State

- 0 : NONE
- 1 : PARAMETER VALUE
- 2 : TYPE MISMATCH
- 3 : SELFTEST
- 4 : HARDWARE
- 5 : MISSING

ACTUAL TYPE

Range: 0000 to FFFF

The type of System Board option fitted.

Enumerated Value : Option Type

- 0 : NONE
- 1 : DUAL ENCODER
- 2 : TYPE 2
- 3 : TYPE 3
- 4 : TYPE 4
- 5 : TYPE 5
- 6 : TYPE 6
- 7 : TYPE 7
- 8 : TYPE 8

VERSION

Range: 0000 to FFFF

The version of the System Board Option. If no option is fitted, or it is faulty, then the version is reset to zero.

FEATURES

Range: 0000 to FFFF

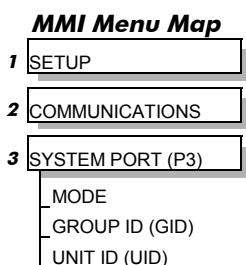

A diagnostic bit field parameter indicating the features supported by the System Board.

Enumerated Value : Features

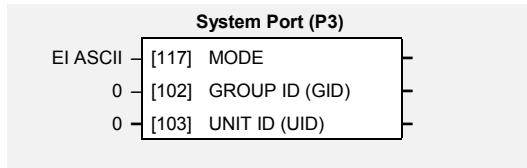

- | | |
|--------------------------|----------------|
| Bit 0 : 12 BIT ANALOG IN | (FALSE / TRUE) |
| Bit 1 : DIGITAL IO | (FALSE / TRUE) |
| Bit 2 : ENCODER INPUTS | (FALSE / TRUE) |
| Bit 3 : MARK INPUTS | (FALSE / TRUE) |

1-114 Programming Your Application

SYSTEM PORT (P3)

The unisolated RS232 programming port(s) allows for connection to the Operator Station, or to a personal computer for drive configuration and storage of parameters. The parameters below are used to identify the Inverter to the controlling software.

The port uses the Eurotherm standard EI BISYNCH ASCII protocol.

Parameter Descriptions

MODE

Range: 0 to 1

Selects the P3 port to operate with the Operator Station (EI ASCII), or a Eurotherm 5703 Setpoint Repeater.

This parameter must be set to 5703 for the 5703 INPUT and 5703 OUTPUT function blocks to operate. Refer to pages 1-7 and 1-8.

Note: *The P3 port always operates in the EI ASCII mode when in Configuration Mode.*

Enumerated Value : Mode

0 : EI ASCII

1 : 5703

GROUP ID (GID)

Range: 0 to 9

The Eurotherm protocol group identity address.

UNIT ID (UID)

Range: 0 to 15

The Eurotherm protocol unit identity address

Functional Description

The unit will always respond to GID = 0 and UID = 0, as this is the “broadcast” address used by the Operator Station.

Note: *The Technology Option uses a different port and address. It does not respond to the “broadcast” address.*

TAPER CALC

MMI Menu Map	
1	SETUP
2	WINDER
3	TAPER CALC
	HYPERBOLIC TAPER
	STALL ENABLE
	BOOST ENABLE
	FIXED BOOST
	FIXED STALL TEN
	CURRENT CORE
	DIAMETER
	BOOST
	TENSION RAMP
	STALL TENSION
	TAPER SPT
	TENSION SPT
	TAPERED DEMAND
	TENSION DEMAND

This function block profiles tension demand with reel diameter for centre wind applications.

This special block processes the tension and taper set points to produce a composite tension demand value as the diameter builds.

The TENSION DEMAND value is used to set the motor current. This must be connected to the DIAMETER and MINIMUM DIAMETER parameters in the SPEED CALC function block.

Refer to Macro 4.

Taper Calc		
-	TAPERED DEMAND [850]	0.00 %
-	TENSION DEMAND [851]	0.00 %
TRUE	[838] HYPERBOLIC TAPER	
FALSE	[839] STALL ENABLE	
FALSE	[840] BOOST ENABLE	
FALSE	[841] FIXED BOOST	
FALSE	[842] FIXED STALL TEN	
0.00 %	[843] CURRENT CORE	
10.00 %	[844] DIAMETER	
0.00 %	[845] BOOST	
1.000 s	[846] TENSION RAMP	
50.00 %	[847] STALL TENSION	
0.00 %	[848] TAPER SPT	
0.00 %	[849] TENSION SPT	

Parameter Descriptions

HYPERBOLIC TAPER

Range: FALSE / TRUE

If set TRUE, a Hyperbolic Taper profile is applied which reduces the diameter more quickly near the core and less as the diameter approaches the full roll.

If set FALSE, a Linear Taper profile is applied which linearly reduces the tension as the diameter increases.

STALL ENABLE

Range: FALSE / TRUE

When TRUE, the tension demand is either:

STALL TENSION if FIXED STALL TEN is TRUE

or STALL TENSION x TENSION SPT if FIXED STALL TEN is FALSE

When FALSE, Stall Tension is disabled.

BOOST ENABLE

Range: FALSE / TRUE

When TRUE, the tension demand is either:

BOOST if FIXED BOOST is TRUE

or BOOST x TENSION SPT if FIXED BOOST is FALSE

When FALSE, Boost is disabled.

FIXED BOOST

Range: FALSE / TRUE

When TRUE and BOOST ENABLE is TRUE, then the tension demand is the value of BOOST.

FIXED STALL TEN

Range: FALSE / TRUE

When TRUE and STALL ENABLE is TRUE, then the tension demand is the value of STALL TENSION.

CURRENT CORE

Range: 0.00 to 120.00 %

The current core size (from the DIAMETER CALC function block).

DIAMETER

Range: 0.00 to 120.00 %

The calculated diameter (from the DIAMETER CALC function block).

BOOST

Range: -200.00 to 200.00 %

Sets a fixed boost, enabled by FIXED BOOST.

1-116 Programming Your Application

TENSION RAMP

Range: 0.000 to 300.000 s

The time taken for TENSION SPT to change from 0 to 100%.

STALL TENSION

Range: -100.00 to 100.00 %

Sets a fixed stall tension, enabled by FIXED STALL TEN.

TAPER SPT

Range: -100.00 to 100.00 %

The taper setpoint input.

TENSION SPT

Range: -200.00 to 200.00 %

The tension setpoint input.

TAPERED DEMAND

Range: —.00 %

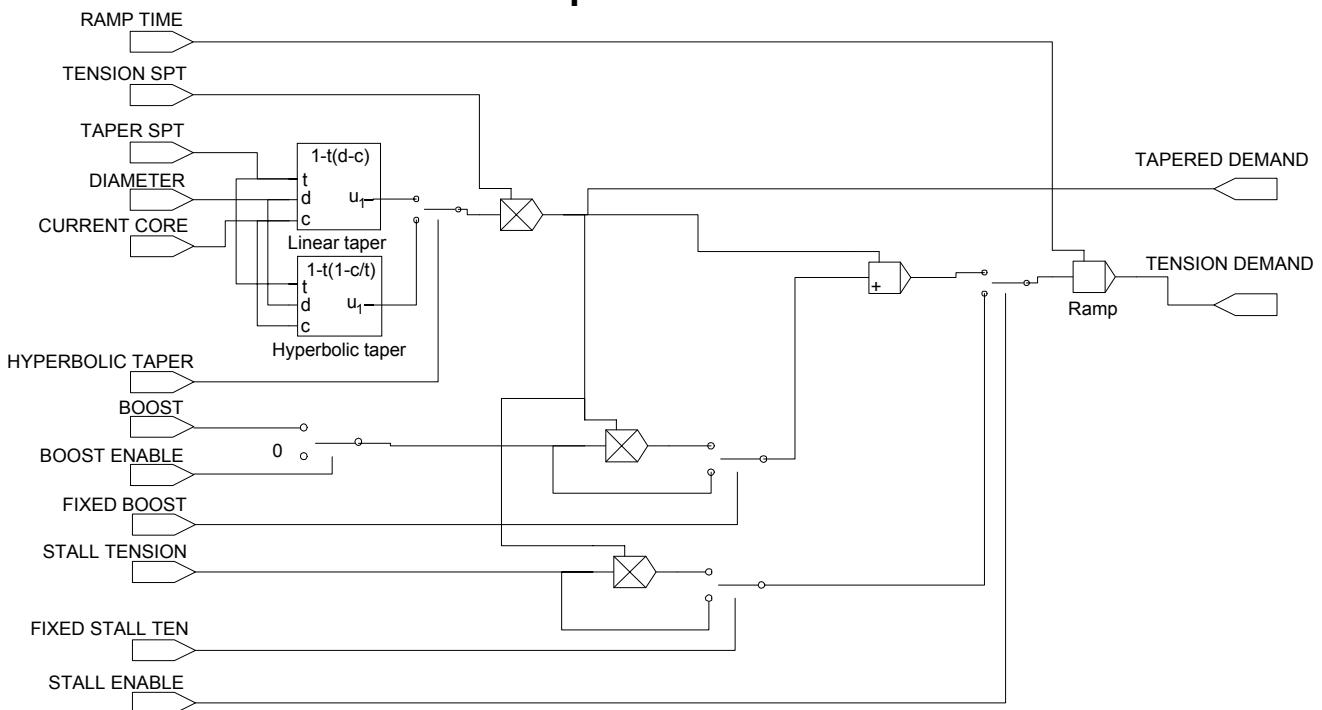

The tapered demand diagnostic.

TENSION DEMAND

Range: —.00 %

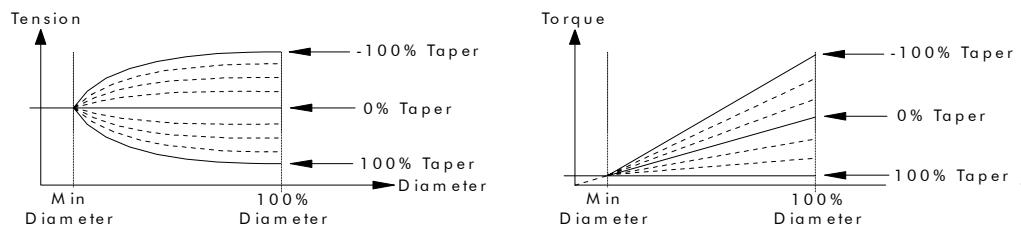

The tension demand diagnostic.

Functional Description

Hyperbolic Taper

A fixed hyperbolic taper characteristic is supplied with this block which has the following tension characteristics:-

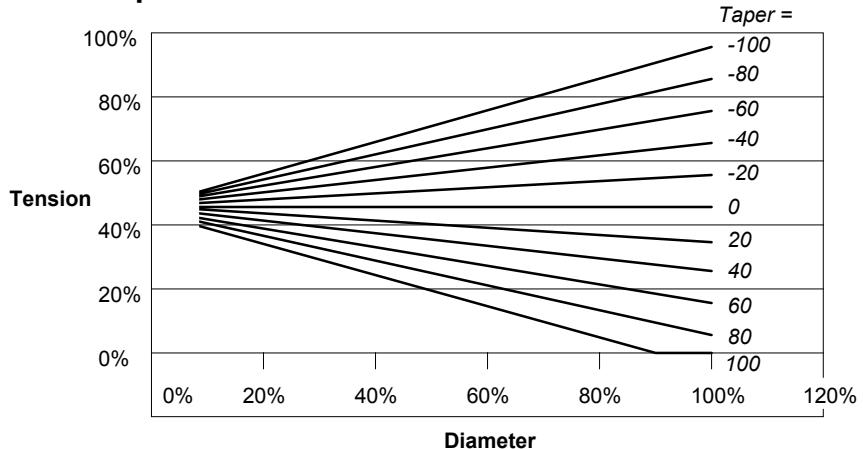

- If the Taper input is 0% this gives a constant tension characteristic with diameter.
- If the taper input is between 0 and 100%, this gives tension falling with increasing diameter. This is sometimes known as negative taper.
- If the taper input is between 0 and -100%, this gives tension rising with increasing diameter. This is sometimes known as positive taper.

All taper characteristics start at the tension setpoint, at minimum diameter.

The following equation shows the actual taper calculation (ignoring boost and stall).

$$\text{Tapered Demand} = \text{Tension Spt} \times \left\{ 100\% - \text{Taper} \times \left(1 - \frac{\text{Core}}{\text{Diameter}} \right) \right\}$$

Linear Taper

$$\text{Tapered Demand} = \text{Tension Spt} \times \left\{ 100\% - \text{Taper} \times (\text{Diameter} - \text{Core}) \right\}$$

TEC OPTION

MMI Menu Map

- 12 : TYPE 12
- 13 : TYPE 13
- 14 : TYPE 14
- 15 : TYPE 15

INPUT 1 to INPUT 5

Range: -32768 to 32767

The use of these input parameters depends on the type of Technology Option fitted.
Refer to the Technology Option Technical Manual.

FAULT

Range: Enumerated - see below

The fault state of the Technology Option.

Enumerated Value : Fault State

- 0 : NONE
- 1 : PARAMETER VALUE
- 2 : TYPE MISMATCH
- 3 : SELFTEST
- 4 : HARDWARE
- 5 : MISSING

VERSION

Range: 0000 to FFFF

The version of the Technology Option. If no option is fitted then the version is reset to zero.

OUTPUT 1 and OUTPUT 2

Range: 0000 to FFFF

The use of these output parameters depends on the type of Technology Option fitted.
Refer to the Technology Option Technical Manual.

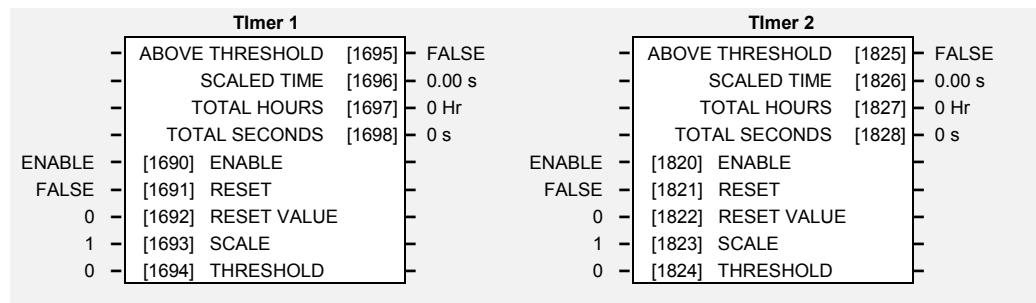

TIMER

MMI Menu Map

- 1 SETUP
- 2 MISCELLANEOUS
- 3 TIMER
 - ENABLE
 - RESET
 - RESET VALUE
 - SCALE
 - THRESHOLD
 - ABOVE THRESHOLD
 - SCALED TIME
 - TOTAL HOURS
 - TOTAL SECONDS

This block records the total time that an application has been running.

The function block maintains the elapsed time as a count of seconds. This value is updated at the function block execution period and is accurate to within one second. The elapsed time is preserved during the power-down of the drive.

Parameter Descriptions

ENABLE

Range: ENABLE/HOLD

This input is used to enable counting. The block is enabled by default. If ENABLE is False, the elapsed time is held at the present value. When ENABLE is set True, the elapsed time continues to increment from the held value.

RESET

Range: FALSE / TRUE

This input is used to preset the elapsed time counter to a desired value. The default for RESET VALUE is 0, so setting RESET to True will set the elapsed time to 0. The RESET input is level sensitive, (not edge). Setting RESET to False has no effect.

RESET VALUE

Range: 1 to 214748364

This input is used to preset the elapsed time counter to a desired value. Setting RESET VALUE to say 30 and setting RESET to True will set the elapsed time to 30.

SCALE

Range: 0 to 2147483647

This input is used to generate the customised timer output called SCALED TIME.

THRESHOLD

Range: -2147483647 to +2147483647

The THRESHOLD input is used in conjunction with the ABOVE THRESHOLD output.

Set THRESHOLD to zero or a positive value and the elapsed time will count up to 2147483647 and then stop, (68 years).

This input may also be used to define the maximum value that the elapsed time may count up to. Set THRESHOLD to a negative value and the elapsed time will count up to the absolute value of THRESHOLD and then automatically reset to 0 and continue counting. The output will be held at the THRESHOLD value for one function block update period.

ABOVE THRESHOLD

Range: FALSE / TRUE

The ABOVE THRESHOLD Boolean output is set True when the elapsed time is greater than or equal to the absolute value of THRESHOLD.

SCALED TIME

Range: 0.00 to 32767.00

The result of TOTAL SECONDS / SCALE.

TOTAL HOURS

Range: 0 to 65535 Hr

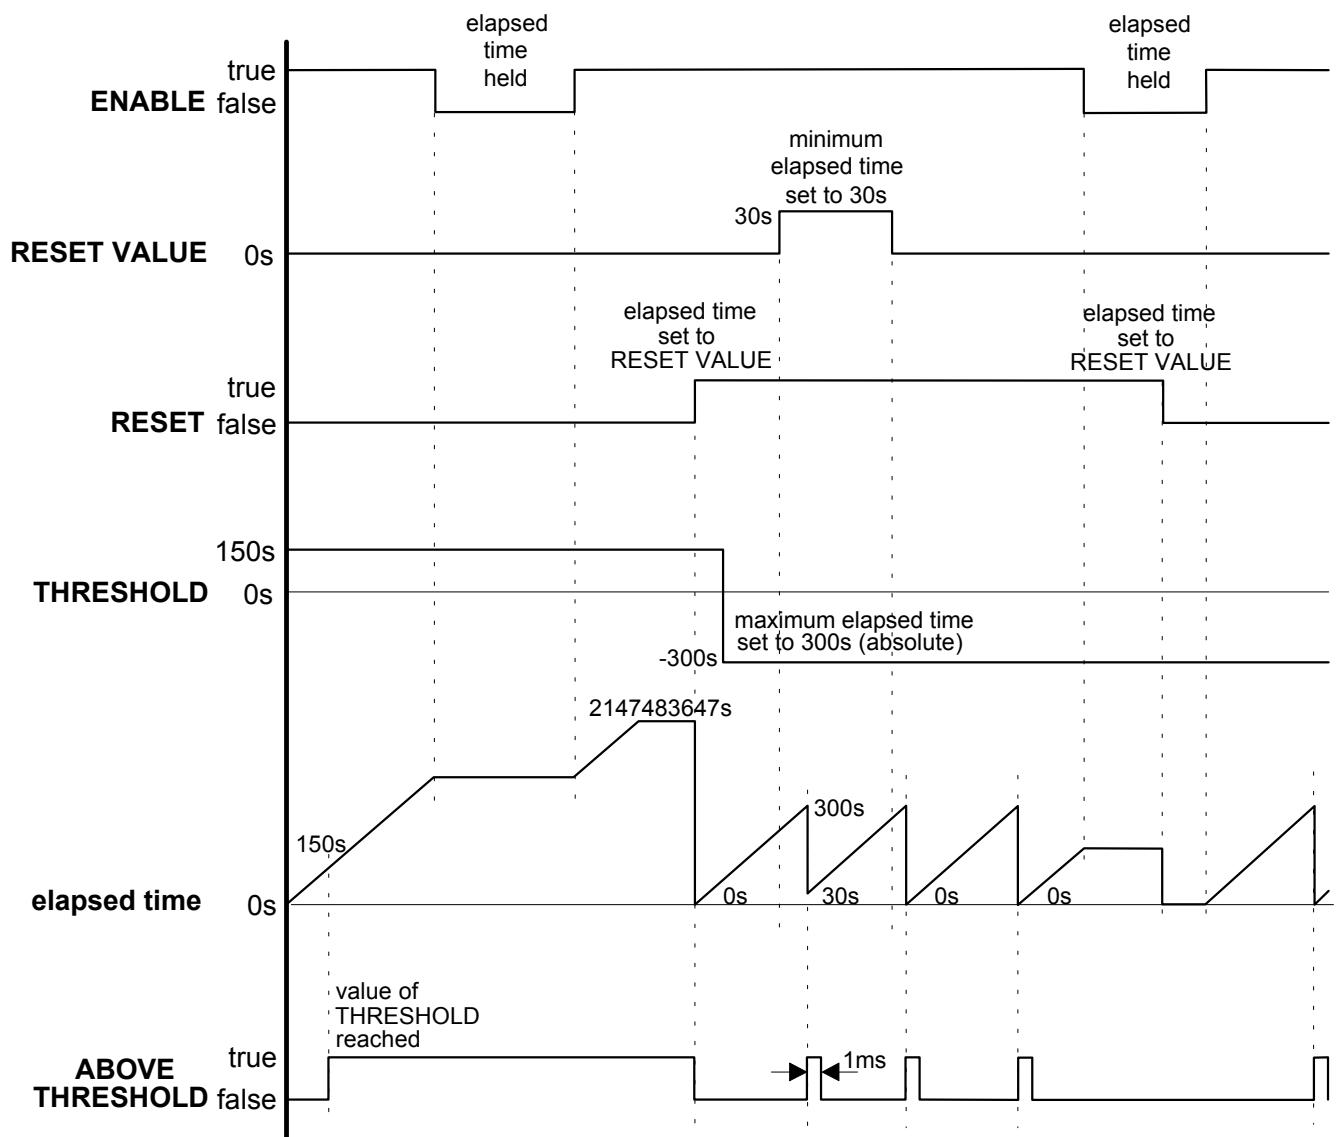

The TOTAL HOURS output is elapsed time expressed in hours, with no fractional part. This is limited to 65535 hours, (7 ½ years), to allow reliable access using 16-bit fieldbus comms.

TOTAL SECONDS

Range: 0 to 2147483647 s

The TOTAL SECONDS output is the elapsed time expressed in seconds

Functional Description

TORQUE CALC

MMI Menu Map

- 1 SETUP
- 2 WINDER
- 3 TORQUE CALC
 - OVER-WIND
 - REWIND
 - TENSION ENABLE
 - TORQUE DEMAND
 - TORQUE LIMIT
 - POS TORQUE LIMIT
 - NEG TORQUE LIMIT

This function block interfaces the calculated winder tension demand to the torque loop, for open-loop centre wind applications.

Refer to Macro 4.

Torque Calc	
POS TORQUE LIMIT	[790] 150.00 %
NEG TORQUE LIMIT	[791] -150.00 %
[786] OVER-WIND	
[1550] REWIND	
[787] TENSION ENABLE	
[788] TORQUE DEMAND	
[789] TORQUE LIMIT	

Parameter Descriptions

OVER-WIND

Range: FALSE / TRUE

Overwind mode selected when TRUE.

REWIND

Range: FALSE / TRUE

The Rewind mode is selected when TRUE.

TENSION ENABLE

Range: FALSE / TRUE

Set FALSE, the drive is speed controlled with the speed compensated by the roll diameter to provide the roll surface speed matched to line speed. This also provides jog with constant surface speed. In this mode the diameter can be preset. This mode is used when the web is not connected to the winder.

Set TRUE, the closed loop trim PID trim is enabled to maintain tension or dancer position. The diameter is calculated as the roll builds up (or builds down for an unwind).

TORQUE DEMAND

Range: -200.00 to 200.00 %

The tension demand input (usually calculated by the TAPER CALC function block).

TORQUE LIMIT

Range: 0.00 to 200.00 %

The torque limit applied when TENSION ENABLE is set FALSE.

POS TORQUE LIMIT

Range: —.00 %

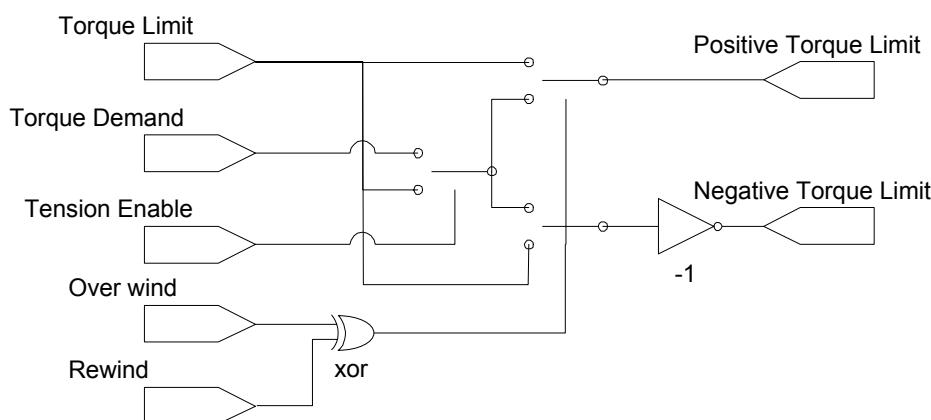

The positive torque limit when TENSION ENABLE is FALSE.

NEG TORQUE LIMIT

Range: —.00 %

The negative torque limit when TENSION ENABLE is FALSE.

Functional Description

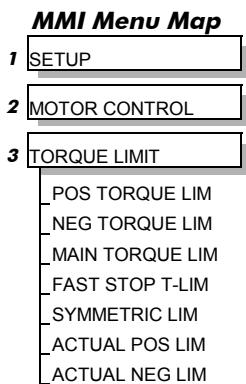

The torque calculator controls web tension by limiting the torque that the controller can produce, this must be used in conjunction with the SPEED CALC function block, which ensures that the speed loop is saturated.

This combination of saturated speed loop and torque limits ensures that, in the event of a web break, the reel will remain under speed control and be limited in speed to:

calculated winder speed + over speed.

TORQUE LIMIT

Designed for all Motor Control Modes.

This function block allows you to set the maximum level of motor rated torque which is allowed before torque limit action occurs.

If the estimated motor torque is greater than the ACTUAL POS LIM value, the motor speed is controlled to maintain the torque at this level. A similar situation occurs if the estimated motor torque is less than the ACTUAL NEG LIM value.

The torque limit function block has separate positive and negative torque limits. In addition, a symmetric main torque limit is also provided.

The lowest positive and negative torque limits (including any current limit or inverse time current limit action) is indicated in the ACTUAL POS LIM and ACTUAL NEG LIM diagnostic. These are the final limits used to limit motor torque.

Torque Limit	
ACTUAL POS LIM	[1212] 0.00 %
ACTUAL NEG LIM	[1213] 0.00 %
150.00 %	[1208] POS TORQUE LIM
-150.00 %	[1209] NEG TORQUE LIM
150.00 %	[1210] MAIN TORQUE LIM
150.00 %	[1554] FAST STOP T-LIM
FALSE	[1211] SYMMETRIC LIM

Parameter Descriptions

POS TORQUE LIM

Range: -300.00 to 300.00 %

This parameter sets the maximum allowed level of positive motor torque.

NEG TORQUE LIM

Range: -300.00 to 300.00 %

This parameter sets the maximum allowed level of negative motor torque

MAIN TORQUE LIM

Range: 0.00 to 300.00 %

This parameter sets the symmetric limit on the maximum allowed motor torque.

FAST STOP T-LIM

Range: 0.00 to 300.00 %

This parameter sets the torque limit used during a Fast Stop.

SYMMETRIC LIM

Range: FALSE / TRUE/

When TRUE, the NEG TORQUE LIM is forced to reflect the POS TORQUE LIM parameter.

ACTUAL POS LIM

Range: —.00 %

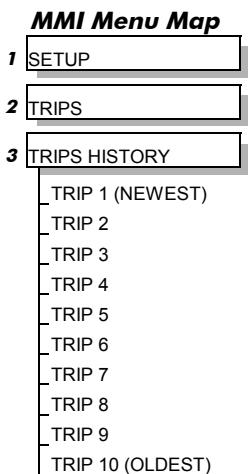

This diagnostic indicates the final actual positive torque limit including any current limit or inverse time current limit action.

ACTUAL NEG LIM

Range: —.00 %

This diagnostic indicates the final actual negative torque limit including any current limit or inverse time current limit action.

TRIPS HISTORY

This function block records the last ten trips that caused the Inverter to stop.

To do this, it stores the value of the FIRST TRIP parameter, tag number 6, taken from the TRIPS STATUS function block.

Trips History

TRIP 1 (NEWEST) [500]	- NO TRIP
TRIP 2 [501]	- NO TRIP
TRIP 3 [502]	- NO TRIP
TRIP 4 [503]	- NO TRIP
TRIP 5 [504]	- NO TRIP
TRIP 6 [505]	- NO TRIP
TRIP 7 [506]	- NO TRIP
TRIP 8 [507]	- NO TRIP
TRIP 9 [508]	- NO TRIP
TRIP 10 (OLDEST) [509]	- NO TRIP

Parameter Descriptions

TRIP 1 (NEWEST)

Range: Enumerated

Records the most recent trip that caused the Inverter to stop. The values that this (and the parameters below) may take are the same as tag number 6, FIRST TRIP, detailed in the TRIPS STATUS function block.

TRIP 2

Range: As above

Records the second most recent trip that caused the Inverter to stop.

TRIP 3

Range: As above

Records the third most recent trip that caused the Inverter to stop.

TRIP 4

Range: As above

Records the fourth most recent trip that caused the Inverter to stop.

TRIP 5

Range: As above

Records the fifth most recent trip that caused the Inverter to stop.

TRIP 6

Range: As above

Records the sixth most recent trip that caused the Inverter to stop.

TRIP 7

Range: As above

Records the seventh most recent trip that caused the Inverter to stop.

TRIP 8

Range: As above

Records the eighth most recent trip that caused the Inverter to stop.

TRIP 9

Range: As above

Records the ninth most recent trip that caused the Inverter to stop.

TRIP 10 (OLDEST)

Range: As above

Records the tenth most recent trip that caused the Inverter to stop.

Functional Description

This function block provides a view of the ten most recent trips that caused the Inverter to stop. Every time a new trip occurs this is entered as TRIP 1 (NEWEST) and the other recorded trips are moved down. If more than ten trips have occurred since the Inverter was configured then only the ten most recent trips will be available for inspection.

These parameters are preserved through a power failure.

TRIPS STATUS

MMI Menu Map

1	SETUP
2	TRIPS
3	TRIPS STATUS

- DISABLED TRIPS
- DISABLED TRIPS+
- ACTIVE TRIPS
- ACTIVE TRIPS+
- TRIP WARNINGS
- TRIP WARNINGS+
- FIRST TRIP

The Inverter supports advanced and flexible trip logic to support monitoring of the Inverter itself, the motor and the load. This function block provides a view into the current trip condition(s) and allows some trips to be disabled.

Trips Status	
ACTIVE TRIPS	[4]
ACTIVE TRIPS+	[740]
WARNINGS	[5]
WARNINGS+	[741]
FIRST TRIP	[6]
0700	- NO TRIP
[231]	DISABLED TRIPS
0040	-
[742]	DISABLED TRIPS+

Parameter Descriptions

DISABLED TRIPS and DISABLED TRIPS+

Range: 0000 to FFFF

Indicates which trips have been disabled. Not all trips may be disabled, the DISABLED TRIPS mask is ignored for trips that cannot be disabled. See below for which trips may be disabled and how this parameter is formed.

ACTIVE TRIPS and ACTIVE TRIPS+

Range: 0000 to FFFF

Indicates which trips are currently active. These parameters are a coded representation of the trip status. See below for a description of how this parameter is formed.

WARNINGS and WARNINGS+

Range: 0000 to FFFF

Indicates which conditions are likely to cause a trip. These parameters are a coded representation of the warning status. See below for a description of how this parameter is formed.

FIRST TRIP

Range: Enumerated – see table below

From when a trip occurs until that trip is reset, this parameter indicates the trip source. When several trips have occurred, this parameter indicates the first one that was detected.

Functional Description

The tables below shows the possible parameter values for FIRST TRIP, and the TRIPS HISTORY function block.

The ACTIVE TRIPS, WARNINGS, DISABLED TRIPS, TRIGGERS 1 and TRIGGERS 2 parameters use a four digit hexadecimal number to identify individual trips. Each trip has a unique corresponding number as shown below.

Trip Name (MMI)	Value	Mask	User Disable	Auto-restart
NO TRIP	0	0x0000	N/A	N/A
OVERVOLTAGE	1	0x0001	No	Yes
UNDERVOLTAGE	2	0x0002	No	Yes
OVERCURRENT	3	0x0004	No	Yes
HEATSINK	4	0x0008	No	Yes
EXTERNAL TRIP	5	0x0010	No	Yes
INPUT 1 BREAK	6	0x0020	Yes	Yes
INPUT 2 BREAK	7	0x0040	Yes	Yes
MOTOR STALLED	8	0x0080	Yes	Yes
INVERSE TIME	9	0x0100	Yes	Yes
BRAKE RESISTOR	10	0x0200	Yes	Yes
BRAKE SWITCH	11	0x0400	Yes	Yes
OP STATION	12	0x0800	Yes	Yes
LOST COMMS	13	0x1000	Yes	Yes
CONTACTOR FBK	14	0x2000	Yes	Yes
SPEED FEEDBACK	15	0x4000	Yes	Yes
AMBIENT TEMP	16	0x8000	No	Yes
MOTOR OVERTEMP	17	0x0001	Yes	Yes
CURRENT LIMIT	18	0x0002	No	Yes

Trip Name (MMI)	Value	Mask +	User Disable	Auto-restart
TRIP 19 (Reserved)	19	0x0004	No	No
24V FAILURE	20	0x0008	Yes	Yes
LOW SPEED OVER I	21	0x0010	No	Yes
TRIP 22 (Reserved)	22	0x0020	No	No
ENCODER 1 FAULT	23	0x0040	Yes	Yes
DESAT (OVER I)	24	0x0080	No	Yes
VDC RIPPLE	25	0x0100	No	Yes
BRAKE SHORT CCT	26	0x0200	No	Yes
OVERSPEED	27	0x0400	Yes	Yes
TRIP 28 (Reserved)	28	0x0800	No	No
TRIP 29 (Reserved)	29	0x1000	No	No
TRIP 30 (Reserved)	30	0x2000	No	No
UNKNOWN	31	0x4000	No	Yes
OTHER	32	0x8000	No	Yes
MAX SPEED LOW	33	0x8000	N/A	N/A
MAINS VOLTS LOW	34	0x8000	N/A	N/A
NOT AT SPEED	35	0x8000	N/A	N/A
MAG CURRENT FAIL	36	0x8000	N/A	N/A
NEGATIVE SLIP F	37	0x8000	N/A	N/A
TR TOO LARGE	38	0x8000	N/A	N/A
TR TOO SMALL	39	0x8000	N/A	N/A
MAX RPM DATA ERR	40	0x8000	N/A	N/A
STACK TRIP	41	0x8000	N/A	N/A
LEAKGE L TIMEOUT	42	0x8000	N/A	N/A
POWER LOSS STOP	43	0x0002	No	Yes

The ACTIVE TRIPS+, WARNINGS+, DISABLED TRIPS+, TRIGGERS+ 1 and TRIGGERS+ 2 parameters use a four digit hexadecimal number to identify individual trips. Each trip has a unique corresponding number as shown below.

Decimal number	Display
10	A
11	B
12	C
13	D
14	E
15	F

Hexadecimal Representation of Trips

When more than one trip is to be represented at the same time then the trip codes are simply added together to form the value displayed. Within each digit, values between 10 and 15 are displayed as letters A to F

For example referring to the tables above, if the ACTIVE TRIPS parameter is **02A8**, then this represents:

- a “2” in digit 3
- an “8” and a “2” in digit 2
(8+2 = 10, displayed as A)
- an “8” in digit 1

This in turn represents the active trips BRAKE RESISTOR, MOTOR STALLED, INPUT 1 BREAK and HEATSINK TEMP, (an unlikely situation).

In the same way, the ACTIVE TRIPS + parameter displaying **02A8** would represent CURRENT LIMIT, DESAT (OVER I), TRIP 22 and 24V failure, (another unlikely situation).

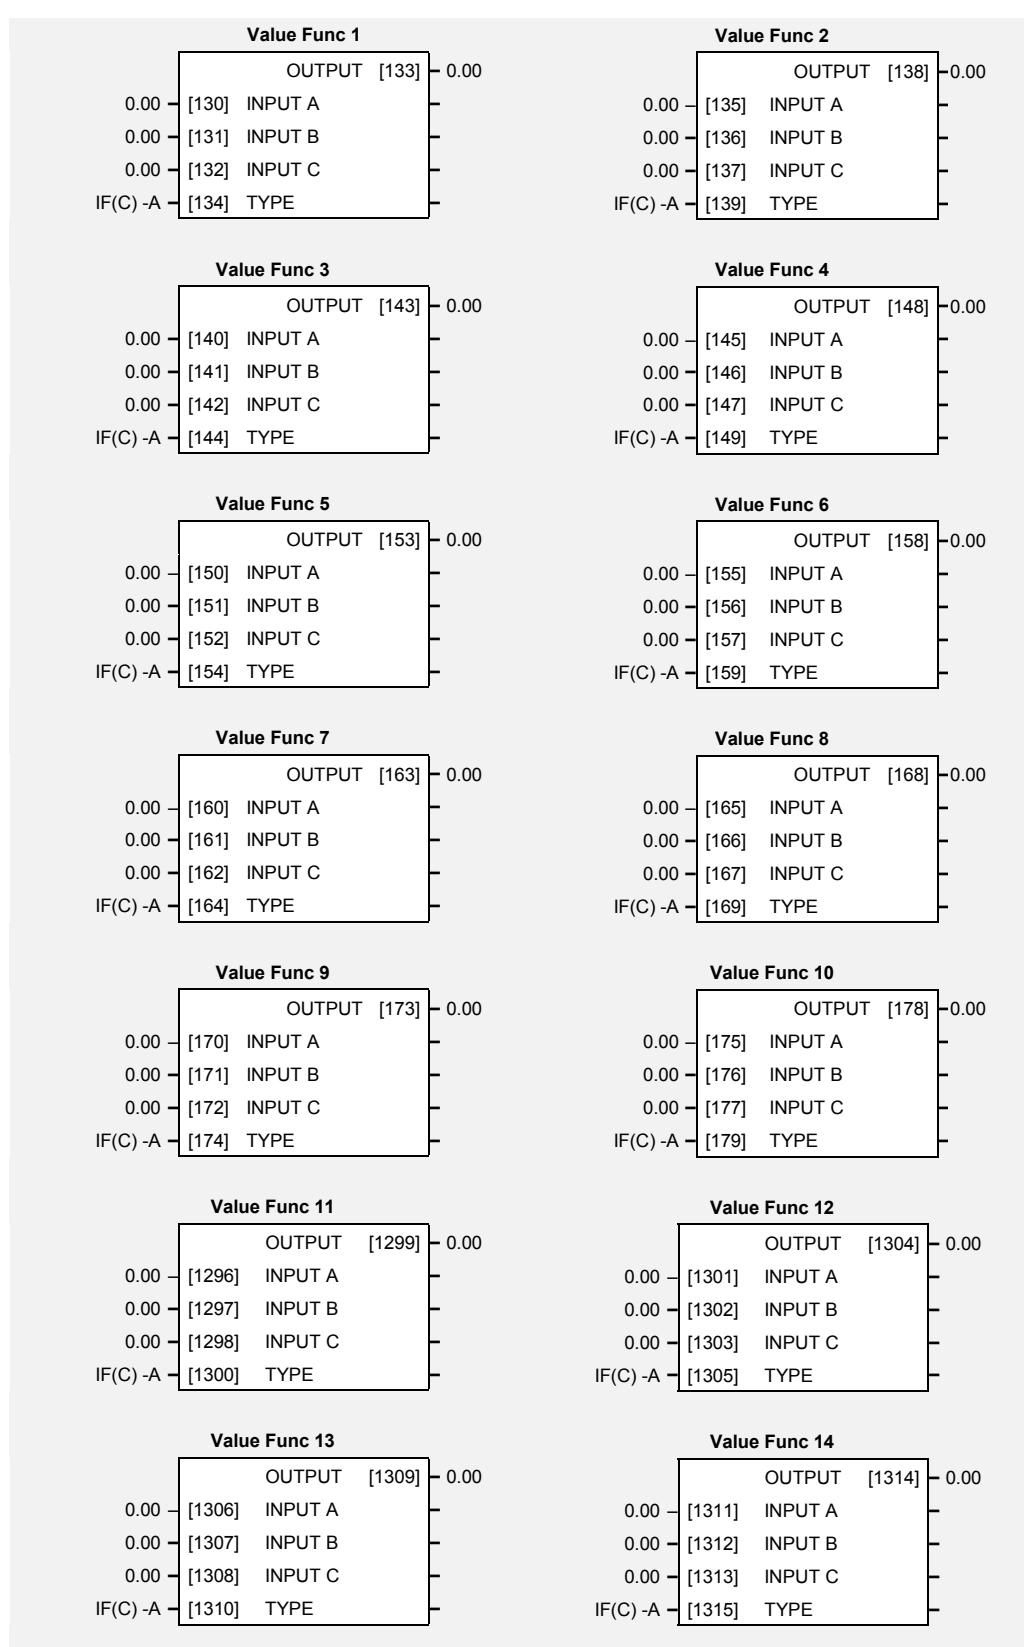

Note: The hexadecimal value is used over comms, however, pressing the **M** key whilst displaying the hexadecimal trip value will show the list of all trips and their current values.

Boolean inputs and outputs are

Outputs: FALSE = 0.00, TRUE = 0.01

Inputs: $-0.005 < x < 0.005$ = FALSE, Else TRUE

Parameter Descriptions

INPUT A

General purpose input.

Range: -32768.00 to 32767.00

INPUT B

General purpose input.

Range: -32768.00 to 32767.00

INPUT C

General purpose input.

Range: -32768.00 to 32767.00

TYPE

Range: Enumerated - see below

The operation to be performed on the three inputs to produce the output value.

Enumerated Value : Type

- 0 : IF(C) -A
- 1 : ABS(A+B+C)
- 2 : SWITCH(A,B)
- 3 : (A*B)/C
- 4 : A+B+C
- 5 : A-B-C
- 6 : B<=A<=C
- 7 : A>B+-C
- 8 : A>=B
- 9 : ABS(A)>B+-C
- 10 : ABS(A)>=B
- 11 : A(1+B)
- 12 : IF(C) HOLD(A)
- 13 : BINARY DECODE
- 14 : ON DELAY
- 15 : OFF DELAY
- 16 : TIMER
- 17 : MINIMUM PULSE
- 18 : PULSE TRAIN
- 19 : WINDOW
- 20 : UP/DWN COUNTER

Enumerated Value : Type

- 21 : (A*B)/C ROUND
- 22 : WINDOW NO HYST
- 23 : WINDOW B<=A<=C
- 24 : A<=B
- 25 : ((A*B)/100) + C
- 26 : MIN (A,B,C)
- 27 : MAX (A,B,C)
- 28 : PROFILE SQRT
- 29 : PROFILE LINEAR
- 30 : PROFILE X^2
- 31 : PROFILE X^3
- 32 : PROFILE X^4

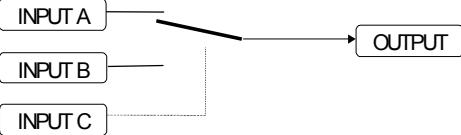

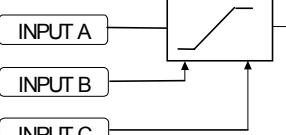

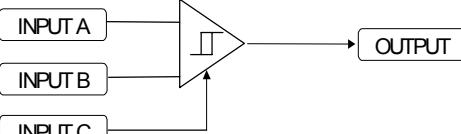

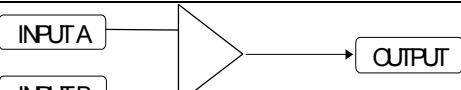

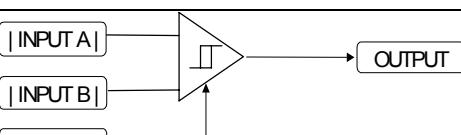

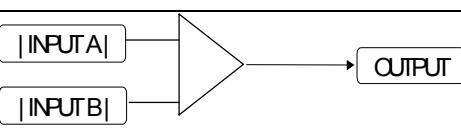

OUTPUT

Range: —.xx

The result of performing the selected operation on the inputs.

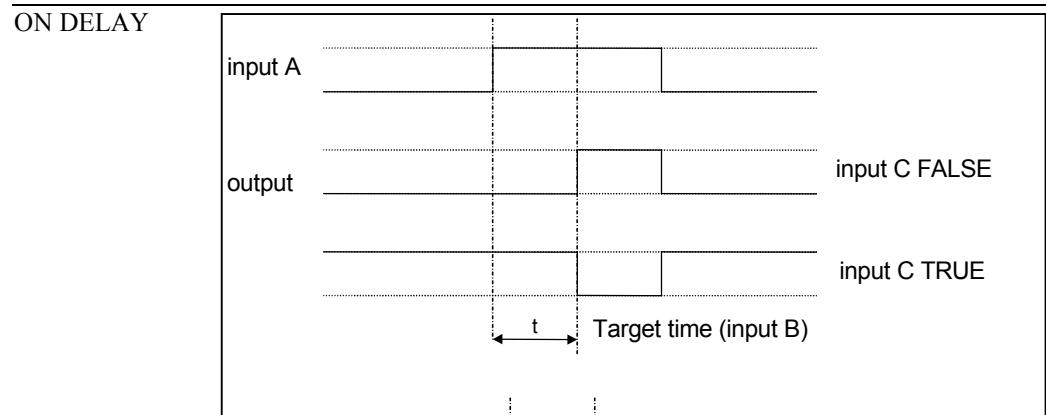

Functional Description

OUTPUT is generated from the inputs according to the operation type selected. The output is always limited to be within the range -32768.00 to +32767.00.

Operation	Description
IF(C) -A	If INPUT C is not zero the OUTPUT is minus INPUT A, otherwise the OUTPUT is the same as INPUT A.
ABS(A+B+C)	The OUTPUT is set to the absolute value of INPUT A + INPUT B + INPUT C.
SWITCH(A,B)	 <p>If INPUT C is zero the OUTPUT is set to INPUT A, otherwise the output is set to INPUT B</p>
(A*B)/C	The OUTPUT is set to $(\text{INPUT A} * \text{INPUT B}) / (\text{INPUT C})$. The algorithm compensates for the remainder term.
A+B+C	The OUTPUT is set to $(\text{INPUT A} + \text{INPUT B} + \text{INPUT C})$.
A-B-C	The OUTPUT is set to $(\text{INPUT A} - \text{INPUT B} - \text{INPUT C})$.
B <= A <= C	 <p>The OUTPUT is set to the value of INPUT A, limited to between a maximum value of INPUT C and a minimum value of INPUT B. If INPUT B is greater than INPUT C the output is undefined.</p>
A>B+-C	 <p>The OUTPUT is TRUE if INPUT A is greater than INPUT B + INPUT C. The OUTPUT is FALSE if INPUT A is less than INPUT B - INPUT C.</p> <p>Otherwise the OUTPUT is unchanged. In this way the block acts as a simple comparator with a comparison level of INPUT B and a hysteresis band equal to +/- INPUT C.</p>
A>=B	 <p>The OUTPUT is TRUE if INPUT A is greater than or equal to INPUT B, otherwise the OUTPUT is FALSE.</p>
ABS(A)> ABS(B)+/-C	 <p>The OUTPUT is TRUE if the magnitude of INPUT A is greater than or equal to the magnitude of INPUT B - INPUT C.</p> <p>The OUTPUT is FALSE if the magnitude of INPUT A is less than the magnitude of INPUT B - INPUT C. Otherwise the OUTPUT is unchanged.</p> <p>In this way the block acts as a magnitude comparator with a comparison level of INPUT B and a hysteresis band equal to +/- INPUT C.</p>
ABS(A)> =ABS(B)	 <p>The OUTPUT is TRUE if the magnitude of INPUT A is greater than or equal to the magnitude of INPUT B, otherwise the OUTPUT is FALSE.</p>
A(1+B)	The OUTPUT is set to $\text{INPUT A} + (\text{INPUT A} * \text{INPUT B} / 100.00)$.

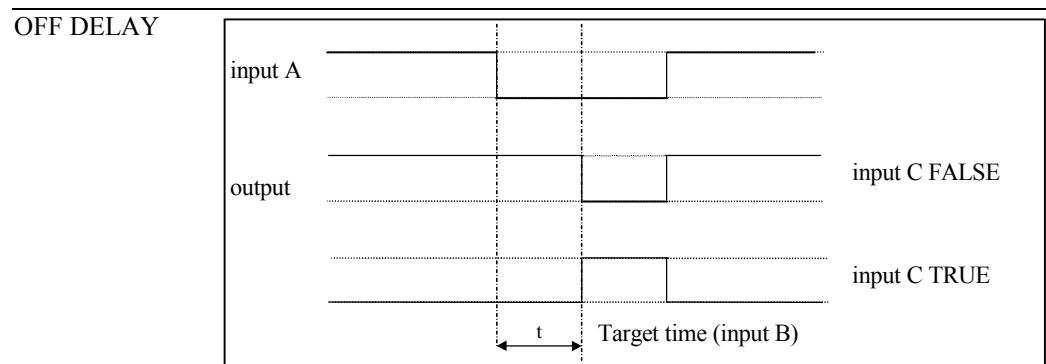

Operation	Description																																							
IF(C) HOLD A	<p>If INPUT C is zero, the OUTPUT is set to INPUT A, otherwise the OUTPUT is unchanged.</p> <p>On powering up the drive, the output will be pre-loaded with the last saved value of input B.</p>

$\neq 0$	$\neq 0$	$\neq 0$	7.00																																					

In the above table, $\neq 0$ indicates that the corresponding input is not zero.

A programmable delay between receiving and outputting a Boolean TRUE signal.

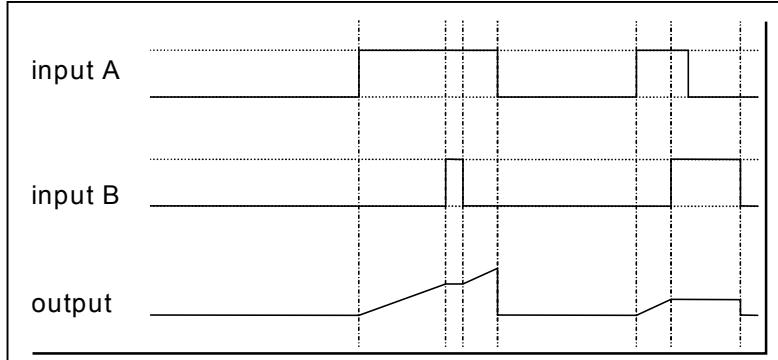

INPUT A becoming TRUE starts the delay timer. INPUT B sets the duration of the delay in seconds (1 = 1 second). At the end of the duration, OUTPUT becomes TRUE unless INPUT A has reverted to FALSE. Setting INPUT C to TRUE ($\neq 0$) inverts the output.

A programmable delay between receiving and outputting a Boolean FALSE signal.

INPUT A becoming FALSE starts the delay timer. INPUT B sets the duration of the delay in seconds (1 = 1 second). Setting INPUT C to TRUE ($\neq 0$) inverts the output. At the end of the duration, OUTPUT becomes FALSE unless INPUT A has reverted to TRUE.

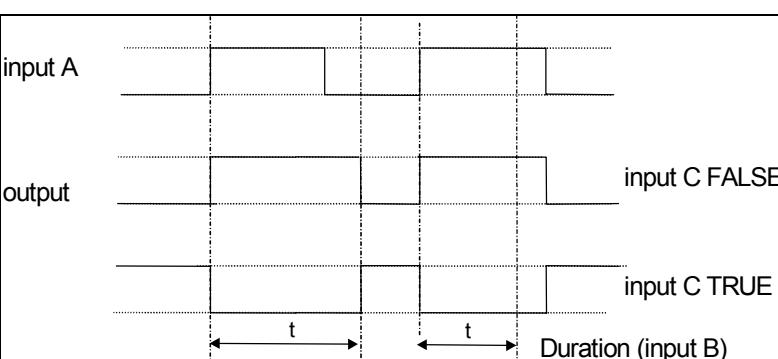

1-130 Programming Your Application

Operation	Description
TIMER	

Times the period elapsed from when INPUT A is set TRUE and held TRUE, to when INPUT B becomes TRUE.

OUTPUT is the duration of the timer in seconds (1 = 1 second), starting from zero. If INPUT B is TRUE, the value for OUTPUT is held until INPUT B is released. If on release INPUT A is still TRUE, the timer will continue from the held value. Setting INPUT A and INPUT B to FALSE resets the timer.

INPUT C is not used.

MINIMUM PULSE	
	

Creates an output of adjustable minimum time when INPUT A is TRUE. (INPUT A is assumed to be a sequence of TRUE pulses and FALSE off periods.)

INPUT B sets the length of the minimum pulse required in seconds (1 = 1 second). INPUT C inverts the output when TRUE. The duration of the pulse is *at least* the period set by INPUT B.

Operation	Description
PULSE TRAIN	<p>The diagram shows two horizontal timelines. The top timeline is labeled 'input_a' and shows a square wave signal. The bottom timeline is labeled 'output' and shows a pulsed signal where the output is high during the 'ON time' and low during the 'OFF time'. Two double-headed arrows below the timelines indicate the duration of the high state: the left arrow is labeled 'ON time (input_b)' and the right arrow is labeled 'OFF time (input_c)'.</p>

Creates a pulsed FALSE / TRUE output of programmable frequency.

INPUT A enables the pulse train when TRUE, disables when FALSE.

INPUT B sets the length of the *on* part of the pulse in seconds (1 = 1 second).

INPUT C sets the length of the *off* part of the pulse in seconds (1 = 1 second).

WINDOW	
	<p>The diagram shows three horizontal timelines. The top timeline is labeled 'input A' and shows a square wave signal. The middle timeline is labeled 'input B threshold' and shows a constant horizontal line. The bottom timeline is labeled 'output' and shows a pulsed signal. Arrows point from 'input C window width' to the input C signal and from 'input C +ve' and 'input C -ve' to the output signal. The output signal is high whenever input A crosses the input B threshold within the window defined by input C.</p>

This function outputs TRUE when INPUT A is within a programmable range, and FALSE otherwise.

INPUT B sets the threshold of the window to be monitored. INPUT C defines the range of the window around the threshold. When the value of INPUT A is inside the window, the window expands by 0.01 to avoid flutter on output if noisy, i.e. if INPUT B = 5 and INPUT C = 4 then the range is 3 to 7, expanded to 2.5 to 7.5 when the value of INPUT A is inside the window.

If INPUT C is set to zero, the output will only be TRUE if INPUT A is exactly equal to INPUT B (this is fulfilled in the default condition when inputs A, B & C are all zero)

If INPUT C is set to a negative value, its absolute value defines the window range, and the output is inverted.

1-132 Programming Your Application

Operation	Description
UP/DOWN COUNTER	

INPUT A provides a rising edge trigger to increment the output count by one.

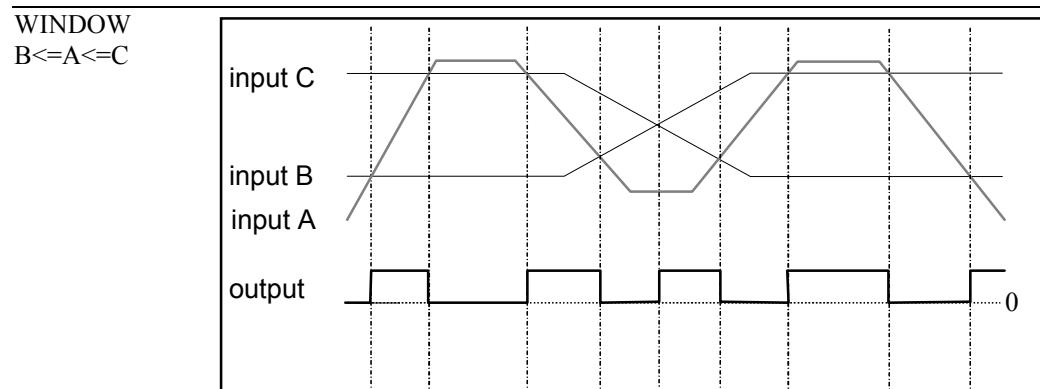

INPUT B provides a rising edge trigger to decrement the output count by one.

INPUT C holds the output at zero.

The output starts at zero. The output is limited at ± 300.00 .

(A*B)/C ROUND	The OUTPUT is set to $(\text{INPUT A} * \text{INPUT B}) / (\text{INPUT C})$. This is the same as $(A*B)/C$ (enumerated value 3) except that the result is rounded.
---------------	---

WINDOW NO HYST	This is the same as WINDOW (enumerated value 19) except that there is no hysteresis when inside the 'window'. Thus, from the diagram given in WINDOW, if INPUT B = 5 and INPUT C = 4 then the range is 3 to 7.
----------------	--

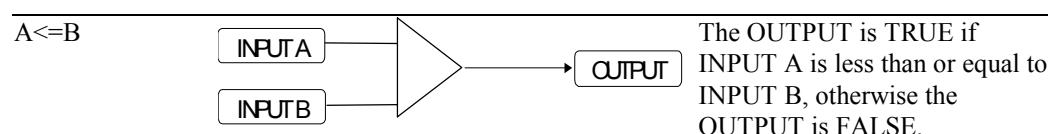

INPUT B and INPUT C are the upper and lower levels of the band.

If $B \leq C$ and A is in the band then the OUTPUT is TRUE, else OUTPUT is FALSE

If $C < B$ and A is in the band then the OUTPUT is FALSE, else OUTPUT is TRUE (i.e. output is inverted)

Note: OUTPUT is set to FALSE if the TYPE is changed or is in initialisation.

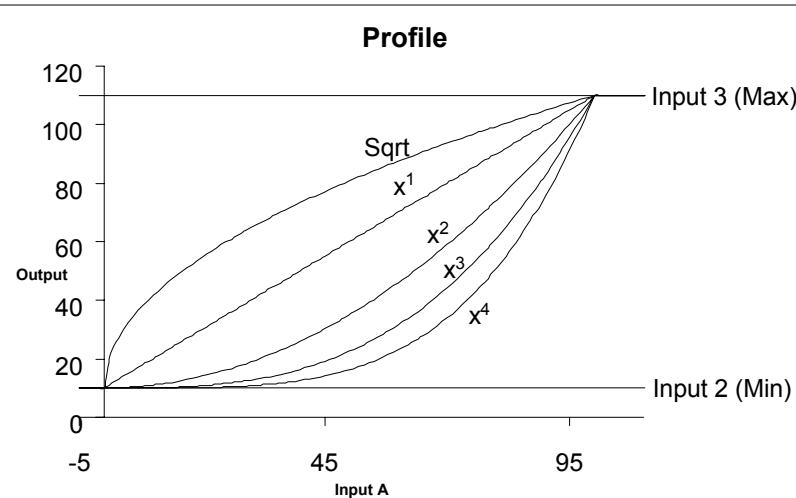

$((A*B)/100)+C$	The OUTPUT is set to $((\text{INPUT A} * \text{INPUT B})/100)+C$.
-----------------	--

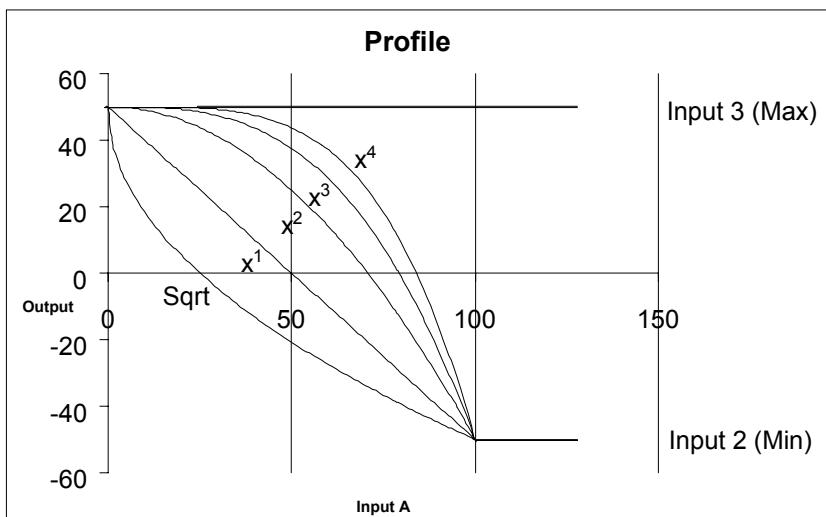

MIN (A,B,C)	The OUTPUT is set to the smallest of INPUT A, INPUT B and INPUT C.
-------------	--

MAX (A,B,C)	The OUTPUT is set to the largest of INPUT A, INPUT B and INPUT C.
-------------	---

Operation	Description
PROFILE SQRT	
PROFILE X ¹	
PROFILE X ²	
PROFILE X ³	
PROFILE X ⁴	

Example : Profile Min = 10, Max = 110

Example : Profile Min = 50, Max = -50

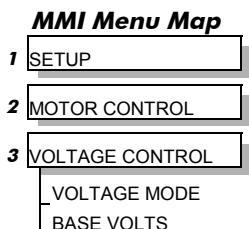

Profile functions convert an input (0-1) to an output with $y = \min + ((\max - \min) * fn(\text{input}))$ where $fn()$ is Sqrt (square root), Linear (X^1), X^2 , X^3 or X^4 . The output is clamped between Min and Max. The input is clamped 0-100.

The profiles are calculated from 100 point tables and linearly interpreted between the points.

PROFILE SQRT	$y = \min + (\max - \min)x^{0.5}$
PROFILE X ¹	$y = \min + (\max - \min)x$
PROFILE X ²	$y = \min + (\max - \min)x^2$
PROFILE X ³	$y = \min + (\max - \min)x^3$
PROFILE X ⁴	$y = \min + (\max - \min)x^4$

where INPUT A : Input x
INPUT B : Min
INPUT C : Max

VOLTAGE CONTROL

Designed for VOLTS/Hz motor Control Mode.

This function block allows the motor output volts to be controlled in the presence of dc link voltage variations. This is achieved by controlling the level of PWM modulation as a function of measured dc link volts. The dc link volts may vary either due to supply variations or regenerative braking by the motor.

Voltage Control	
NONE	[595] VOLTAGE MODE
100.00 %	[112] BASE VOLTS

Three control modes are available, None, Fixed and Automatic.

Parameter Descriptions

VOLTAGE MODE

Range: Enumerated - see below

Set to NONE, no attempt is made to control the PWM modulation depth for variations in dc link voltage.

Set to FIXED, the Inverter's output volts are maintained, regardless of variations in the dc link voltage. The Inverter's product code sets the default value for demanded maximum output voltage.

Set to AUTOMATIC, the voltage is controlled as above, but the output voltage is allowed to rise smoothly as dc link volts vary. This allows the motor to be overfluxed during deceleration, thereby increasing braking performance.

Enumerated Value : Voltage Mode

- 0 : NONE
- 1 : FIXED
- 2 : AUTOMATIC

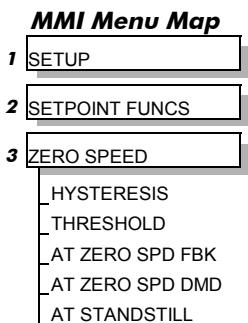

BASE VOLTS

Range: 0.00 to 115.47 %

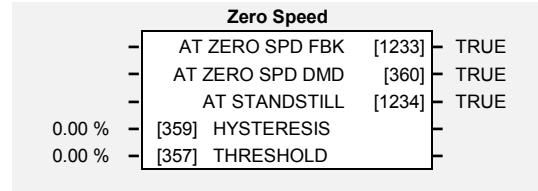

This parameter directly scales the output of the voltage control function block, thus allowing further scaling of the Inverter output volts if required.

Refer also to “Quadratic/Constant Torque Selection”, page 1-136.

ZERO SPEED

This function block detects when the speed is at or close to zero. HYSTERESIS and THRESHOLD are user-definable.

Parameter Descriptions

HYSTERESIS

Range: 0.00 to 300.00 %

Provides a hysteresis band about which the outputs are stable.

IF the hysteresis value is \geq to the Threshold
THEN the level is set to $2 \times$ the hysteresis value and the Off level is set to zero,
ELSE the On level = Threshold + Hysteresis and the Off level = Threshold - Hysteresis.

THRESHOLD

Range: 0.00 to 300.00 %

The nominal level below which the outputs are set.

AT ZERO SPD FBK

Range: FALSE / TRUE

Speed feedback. TRUE when at zero speed feedback, as defined by THRESHOLD and HYSTERESIS.

IF $(\text{abs}(\text{speed feedback})) > \text{On Level at zero speed}$ = FALSE
ELSE if $(\text{abs}(\text{speed feedback})) \leq \text{Off Level at zero speed}$ = TRUE
ELSE at zero speed is unchanged

AT ZERO SPD DMD

Range: FALSE / TRUE

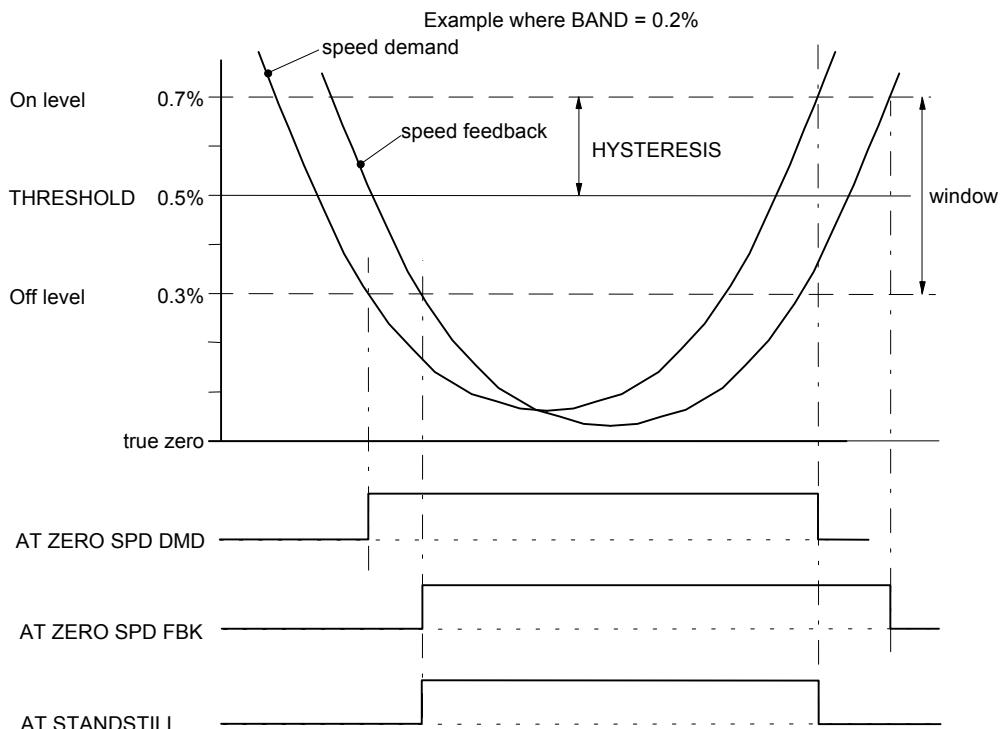

Speed demand. TRUE when at zero speed demand, as defined by THRESHOLD and HYSTERESIS.

AT STANDSTILL

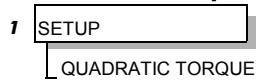

Range: FALSE / TRUE

TRUE when both AT ZERO SPD FBK and AT ZERO SPD DMD are TRUE.

Functional Description

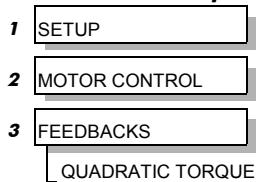

Quadratic/Constant Torque Selection

MMI Menu Map

When selecting or de-selecting Quadratic Torque mode, several parameter values and their limits are modified.

The parameters affected are shown in the table below.

or
MMI Menu Map

Note: When changing to or from Quadratic Torque mode, you will be requested to confirm your actions on the MMI. This is intended to remind you of the effects detailed below.

Change from CONSTANT TORQUE to QUADRATIC TORQUE

Function Block	Parameter	Set to	Note
PATTERN GEN	FREQ SELECT	3 kHz	Cannot be changed
INVERSE TIME	DELAY	60.0 s	High Limit 60.0 s
INVERSE TIME	Max Overload Level	110.0 %	Internal Parameter
CURRENT LIMIT	CURRENT LIMIT	100.0 %	High Limit set 110.0 %
VOLTAGE CONTROL	BASE VOLTS	115.0 %	High Limit 115.47 %

Change from QUADRATIC TORQUE to CONSTANT TORQUE

Function Block	Parameter	Set to	Note
PATTERN GEN	FREQ SELECT	3 kHz	Can be changed
INVERSE TIME	DELAY	60.0 s	High Limit 60.0 s
INVERSE TIME	Max Overload Level	150.0 %	Internal Parameter
CURRENT LIMIT	CURRENT LIMIT	150.0 %	High Limit set 150.0 %
VOLTAGE CONTROL	BASE VOLTS	100.0 %	High Limit 115.47 %

PARAMETER SPECIFICATION

The headings for the Tag No. table are described below.

Tag	A numeric identification of the parameter. It is used to identify the source and destinations of internal links.
Name	The parameter name as it appears on the MMI.
Block	The menu page and function block under which the parameter is stored.
Type	REAL Floating point value INT Integer value BOOL A Boolean (bit) representing FALSE or TRUE ENUM An enumerated value representing a selection STRING An ASCII string TAG A value representing a choice of TAG D_TAG A value representing a choice of Destination tag as an internal link S_TAG A value representing a choice of Source tag as an internal link WORD 16 Bit hexadecimal number
Range	This varies with parameter type: REAL, INT The upper and lower limits of the parameter BOOL 0 = FALSE, 1 = TRUE ENUM A list of possible selections for that parameter STRING Specified number of characters TAG The tag number of any parameter D_TAG The tag number of an input parameter S_TAG The tag number of an input or output parameter. WORD 0000 to FFFF (hexadecimal), numbered lists show Bit numbers Note: <i>Decimal Places:</i> “—” signifies an indeterminable number of units. An “x” signifies a decimal place, e.g. —.xx % could represent 100.00 %.
ID	Serial Communications Mnemonic: Refer to Chapter 3: “Serial Communications”
Notes	You can record your application’s settings here. Output parameters are not saved in non-volatile memory unless indicated. 1. This input parameter is not saved in non-volatile memory. 2. This parameter is automatically saved in non-volatile memory. 3. This parameter forms part of the motor configuration. 4. This parameter is not adjustable from the operator station. 5. This parameter cannot be the destination of a link. 6. This parameter cannot be the source of a link. 7. This input parameter can only be written to when the Inverter is stopped. 8. This input parameter can only be written to when the Inverter is in configuration mode. 9. This input parameter is not writable from serial comms. 10. This parameter uses special scaling rules when accessed using certain Comms options of the 6053 Technology Box. Refer to page 2-39.

1519	LIMIT	PHASE PID	.xx

Product-Related Default Values

All examples given in this book are based on a UK, 400V, 50Hz, 7.5kW Inverter.

* Frequency Dependent Defaults

These parameter values (marked with “**” in function block descriptions and macro diagrams) are dependent upon the drive’s default motor base frequency. The following table lists the changes to the “** Power Dependent Defaults” tables below for those parameters whose settings are adjusted for operation at 60Hz.

Parameter	Function Block	Tag	60Hz Operation
BASE FREQUENCY	MOTOR DATA	1159	60Hz
MOTOR CONNECTION	MOTOR DATA	124	STAR
MOTOR VOLTAGE	MOTOR DATA	1160	*
NAMEPLATE RPM	MOTOR DATA	83	1750 RPM
MAX SPEED	SETPOINT SCALE	1032	1800 RPM
BASE FREQUENCY	FLUXING	106	60.0Hz
* 230V unit : 230V, 400V unit : 460V, 500V unit : 500V			

** Power Dependent Defaults

These parameters (marked with “***” in function block descriptions and macro diagrams) are set to a value depending on the overall “power-build” of the Inverter indicated by the Product Code.

FRAME B - 230V Build Power Dependent Defaults									
Parameter	Function Block	Tag	Single Phase			Three Phase

SERIAL COMMUNICATIONS

Communications Technology Option

The plug-in COMMS Technology Option provides a serial data port, allowing Inverters to be linked to form a network. Using a PLC/SCADA or other intelligent device, this network can be continuously controlled to provide supervision and monitoring for each Inverter in the system.

Refer to the Communications Interface Technical Manual for further details.

ConfigEd Lite

This is Eurotherm Drives' Windows-based block programming software. It has a graphical user-interface and drawing tools to allow you to create block programming diagrams quickly and easily. Contact your local Eurotherm Drives sales office.

Connection to the P3 Port

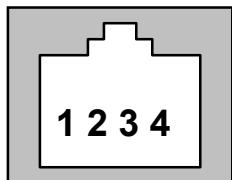

The port is an un-isolated RS232, 19200 Baud, supporting the standard EI bisynch ASCII communications protocol. Contact Eurotherm Drives for further information.

- Frame B** : The P3 port is on the front of the unit and is used by the Operator Station.
- Frame C, D & E** : There are two ports - one is used by the Operator Station, and the second is under the terminal cover to the right of the Control Terminals.

Using any P3 port on the drive, parameters can be monitored and updated by a suitable PC programming tool, e.g. ConfigEd Lite.

P3 Port

A standard P3 lead is used to connect to the Inverter.

P3 Port Pin	Lead	Signal
1	Black	0V
2	Red	5V
3	Green	TX
4	Yellow	RX

6-Way Lead to DB9/DB25 Connector

Note: There is 5V present on pin 2 of the P3 port - do not connect this to your PC.

P3 Port Pin	Lead	Female DB9 Pin	Female DB25 Pin
1	Black	5	7
2	Red	not connected	not connected
3	Green	2	3
4	Yellow	3	2

3-2 Serial Communications

File Transfer

When you perform a SAVE CONFIG, the settings for all parameters (except motor and frame size specific parameters) are written to a Configuration file. Settings for motor and frame size specific parameters are written to the file "MOTOR1.MOT".

Drives using Software Version 5.x onwards can transfer these files between the drive and a PC.

For further information about Configuration files, refer to the Installation Product Manual, Chapter 5: "The Operator Station" - Saving/Restoring/Deleting Your Application.

Protocol Description

The file transfer protocol is supported by the EI ASCII communications. Connection from the PC is made to either the Operator Station port (P3), or the RS232 programming port (P3) which is located on the control board.

There are two new mnemonics: FR for read and FW for write. Both these commands have the same format:

Address [STX]	Mn	[FS] action
		[GS] block_no [RS] 'ascii_block_data
		[GS] 'file_name [RS] file_length [RS] >file_protected_flag
	[ETX]	[BCC]

Where:

[STX] is the start of text code, 0x02

Mn is the mnemonic, either FR (read) or FW (write)

[FS] is the field separator, 0x1C

Action is an integer value. This specifies the action. 0 for start transfer, 1 for continue transfer, -1 for end transfer.

[GS] is the group separator, 0x1D

Block_no is an integer. It is set to 0 at the start of a data transfer and increments by one for each block received.

[RS] is the record separator, 0x1E

Ascii_block_data is an ascii field. It contains up to 64 ascii characters, (equivalent to 32 bytes of hex data).

File_name an ascii field. It is the name of the file to read or write.

File_length is an integer value. It is the length of file data that is to be written to the file store or was read from the file store. This is the length of binary data and should be half the total number of ascii hex file data bytes transferred

File_protected_flag is a boolean value and may take the value of 0 or 1. A value of 0 indicates that the file is not protected. A value of 1 indicates that the file is protected. At present, protected files may not be read from the drive so a value of 1 will never be returned.

[ETX] is the end of text code, 0x04

[BCC] is the binary check character, the value depends on the message contents.

File Read (FR)

Reading a file is achieved using the FR mnemonic. The FR write command is used to specify the name of the file to read. For example, to read the Configuration file “APPLICATION” from a drive at address 00 (note the address is always entered twice, so if the address is 01 you enter 0011):

Request:

0 0 0 0 [STX] F R [FS] 0 [GS] [GS]‘ A P P L I C A T I O N . C F G [ETX] [BCC]

On receiving this command the drive will read the specified file from the file-store into a RAM buffer. If the file is protected or is not found then the drive will reply with a NAK.

Request:

The FR read command is then used to read the file from the RAM buffer:

0 0 0 0 F R [ENQ]

[ENQ] is the enquiry character, 0x05

Response:

A: [STX] F R [FS] 0 [GS] [GS] file_name [RS] file length [RS] protected flag [EXT] [BCC]

B: [STX] F R [FS] 1 [GS] block_number [RS] block_data [EXT] [BCC]

C: [STX] F R [FS] -1 [EXT] [BCC]

Response A is returned following the first FR read command after a FR write. It has an action of 0 indicating that this is the start of the read process. This reply contains the file name, the file length and the file protected flag.

Response B is returned while data is being transferred.

Response C is returned once all data has been transferred. This has an action of -1 indicating that file transfer has finished.

Should the receiving equipment notice a communications failure, such as a missing block, a transfer may be restarted using the FR write command. The FR write command may contain a block number if you want to restart the transfer from a block other than 0.

File Write (FW)

The file write command FW is used to write file data to the drive. This mirrors the use of the FR command. The format of the message is:

Request:

A: 0000 [STX] F W [FS] 0 [GS] [GS] name [RS] length [RS] protected [EXT] [BCC]

B: 0000 [STX] F W [FS] 1 [GS] block_number [RS] block_data [EXT] [BCC]

C: 0000 [STX] F W [FS] -1 [EXT] [BCC]

Request A is used to initiate a write. This has an action of 0 and contains the file name, the file length and the file protected flag.

Request B is used to transfer the file data in blocks of up to 64 ascii hex characters.

Request C is used to indicate that the file transfer is complete and that the file should be committed to non-volatile data. On receiving this request the drive validates the contents of the file data. The data is expected to be in the same format as that returned by the FR command. This includes a checksum that is used by this validation process. If the file data is valid then it is written to the file store. As part of this process, the file store automatically creates a backup of any existing configuration of the same name as that being written. This backup copy will be used if the file save fails.

3-4 Serial Communications

Interaction with the 6901 Operator Station

The file transfer process shares a RAM buffer with the operator station cloning feature. If a clone save or restore is started while a file transfer is in progress, then the file transfer will be aborted.

Note: *The file transfer feature may not be used to directly read a file from the operator station or to write a file to the operator station.*

File Names

The drive may contain several Configuration files. Each of these contains all application data with the exception of those parameters that are motor or frame size specific. Configuration file names may be between one and eleven characters long and have an extension of ".CFG". The default Configuration file name is "APPLICATION.CFG".

Motor and frame size specific data is held in the file "MOTOR 1.MOT".

SEQUENCING LOGIC STATES

Principle State Machine

The Inverter's reaction to commands is defined by a state machine. This determines which commands provide the demanded action, and in which sequence.

Main Sequencing States

The main sequencing state of the unit is indicated by an enumerated value given by the parameter SEQUENCER STATE under SEQUENCING LOGIC menu at level 3.

Enumerated Value	Main Seq State	Standard Name	Description
0	START DISABLED	Switch On Disabled	The Inverter will not accept a switch on command
1	START ENABLED	Ready To Switch On	The Inverter will accept a switch on command
2	SWITCHED ON	Switched On	The Inverter's stack is enabled
3	READY	Ready	Waiting for Contactor to be closed
4	ENABLED	Enabled	The Inverter is enabled and operational
5	F-STOP ACTIVE	Fast-Stop Active	Fast stop is active
6	TRIP ACTIVE	Trip Active	The Inverter is processing a trip event
7	TRIPPED	Tripped	The Inverter is tripped awaiting trip reset

Table 4-1 Enumerated Values for the SEQUENCING LOGIC Function Block

State Outputs of the SEQUENCING LOGIC Function Block

The following table shows the states of individual parameters for the SEQUENCING LOGIC function block required to produce the condition of the MAIN SEQ STATE parameter.

	START DISABLED	START ENABLED	SWITCHED ON	READY	ENABLED	F-STOP ACTIVE	TRIP ACTIVE	TRIPPED
Tripped	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	TRUE	TRUE
Running	FALSE	FALSE	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE
Jogging	FALSE	FALSE	FALSE	FALSE	Note 1	FALSE	FALSE	FALSE
Stopping	FALSE	FALSE	FALSE	FALSE	Note 2	TRUE	FALSE	FALSE
Output Contactor	Depends on previous state	Depends on previous state	TRUE	TRUE	TRUE	TRUE	TRUE	FALSE
Switch On Enable	FALSE	TRUE	TRUE	TRUE	TRUE	TRUE	TRUE	FALSE
Switched On	FALSE	FALSE	TRUE	TRUE	TRUE	TRUE	TRUE	FALSE
Ready	FALSE	FALSE	FALSE	TRUE	TRUE	TRUE	TRUE	FALSE
Healthy	TRUE	TRUE	TRUE	TRUE	TRUE	TRUE	FALSE	FALSE Note 3

Table 4-2 Parameter States for the MAIN SEQ STATE Parameter

4-2 Sequencing Logic

- Note:**
1. JOGGING is set TRUE once the jog cycle has started, and remains TRUE until the jog cycle has finished which is when either the stop delay has finished or another mode is demanded.
 2. STOPPING is set TRUE during the stopping cycles commanded by either RUNNING going low, JOGGING going low or if Fast Stop is active, i.e. SEQUENCING LOGIC is F-STOP ACTIVE.
 3. Once Run and Jog are both FALSE, HEALTHY O/P will be set TRUE.

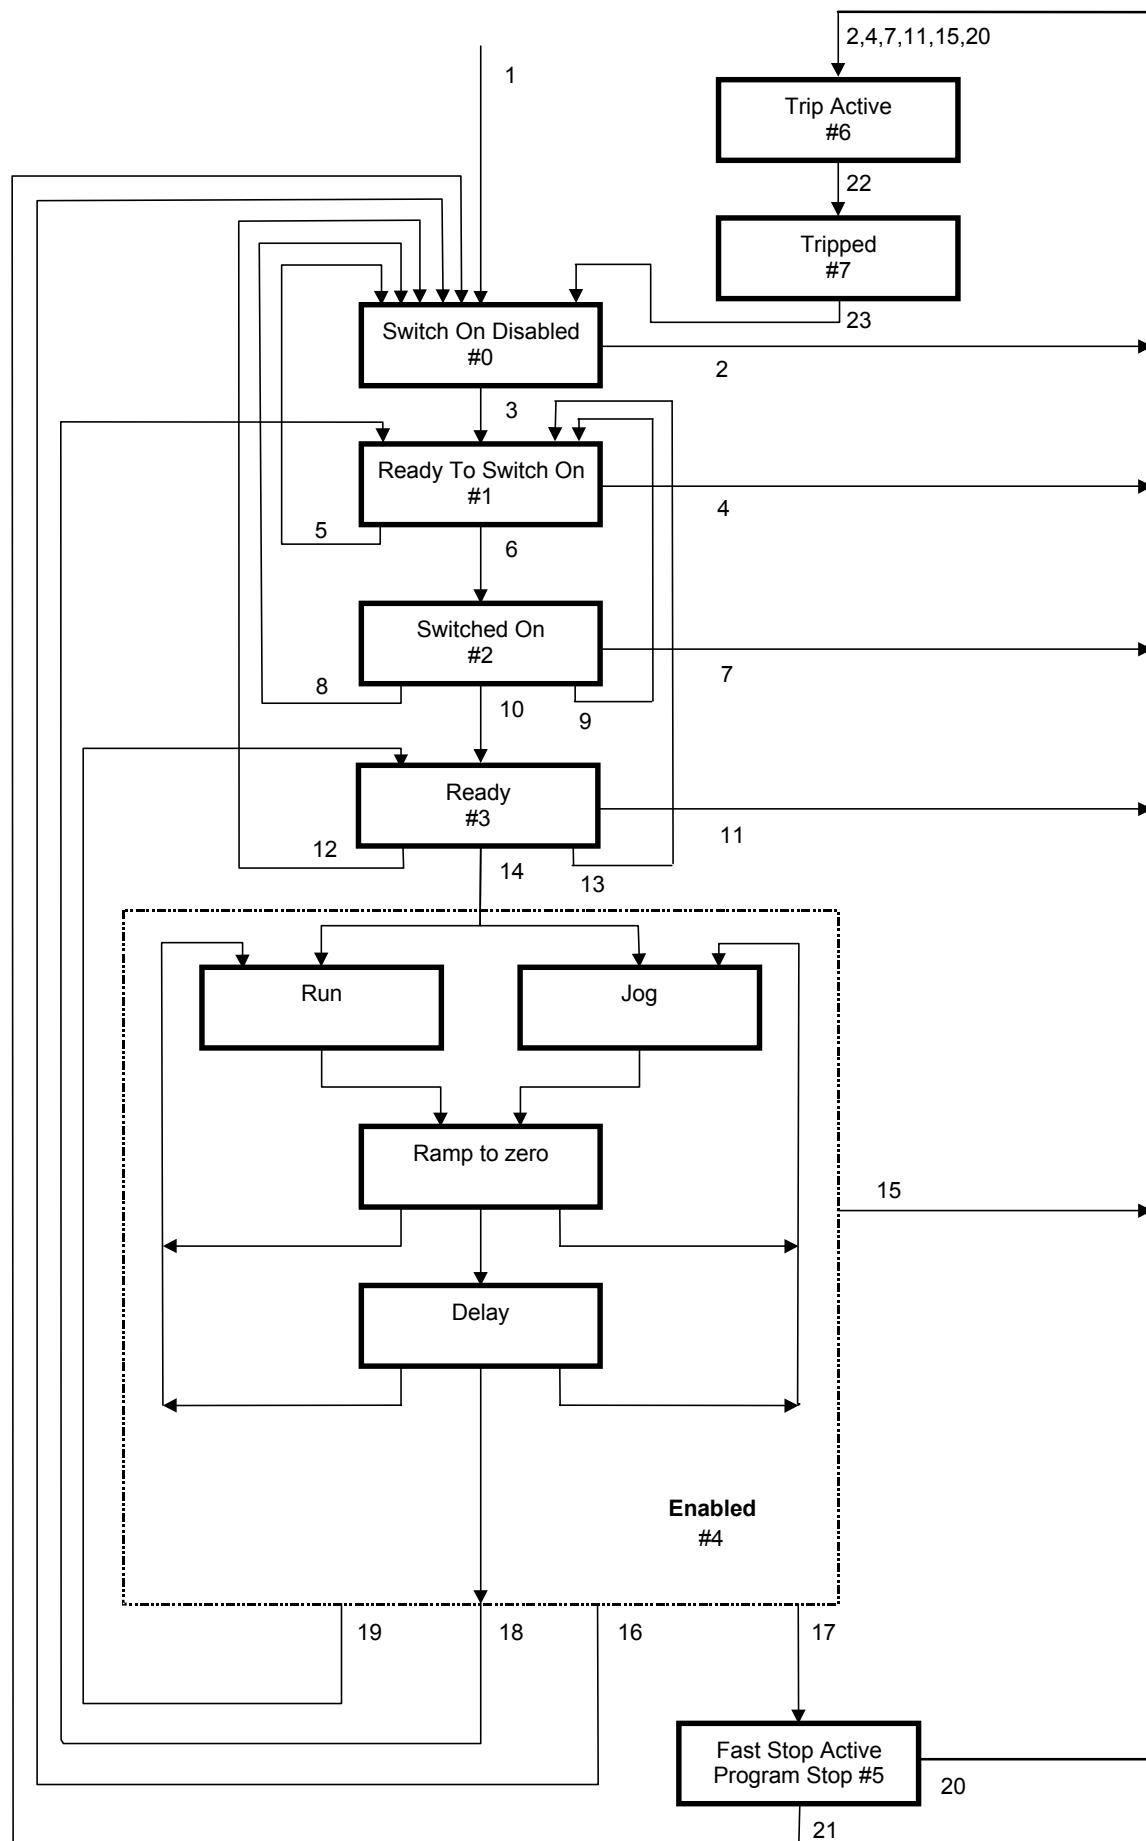

Transition of States

The transition matrix describes what causes the transition from one state to another, for example see no. 4 below: the transition from “Ready To Switch On” to “Trip Active” is triggered by “TRIP” going TRUE. Note – where a state has more than one exit transition, the transition with the lowest number has priority.

Refer to the following table and state diagram.

	Current State	Next State	Cause (FALSE to TRUE)
1	Power Up	Switch On Disabled	Power-Up, Restore Configuration or exit from Configuration mode.
2	Switch On Disabled	Trip Active	Trip
3	Switch On Disabled	Ready To Switch On	RUN = FALSE, JOG = FALSE, NOT FAST STOP = TRUE and NOT COAST STOP = TRUE
4	Ready To Switch On	Trip Active	Trip
5	Ready To Switch On	Switch On Disabled	NOT COAST STOP = FALSE or NOT FAST STOP = FALSE
6	Ready To Switch On	Switched On	RUN = TRUE or JOG = TRUE
7	Switched On	Trip Active	Trip (includes CONTACTOR CLOSED = FALSE after 10 seconds)
8	Switched On	Switch On Disabled	NOT COAST STOP = FALSE or NOT FAST STOP = FALSE
9	Switched On	Ready To Switch On	RUN = FALSE and JOG = FALSE
10	Switched On	Ready	CONTACTOR CLOSED = TRUE and defluxed
11	Ready	Trip Active	Trip (includes CONTACTOR CLOSED = FALSE)
12	Ready	Switch On Disabled	NOT COAST STOP = FALSE or NOT FAST STOP = FALSE
13	Ready	Ready To Switch On	RUN = FALSE and JOG = FALSE
14	Ready	Enabled	ENABLE = TRUE
15	Enabled	Trip Active	Trip (includes CONTACTOR CLOSED = FALSE)
16	Enabled	Switch On Disabled	NOT COAST STOP = FALSE
17	Enabled	Fast Stop Active	NOT FAST STOP = FALSE
18	Enabled	Ready To Switch On	RUN = FALSE, JOG = FALSE and stopping complete
19	Enabled	Ready	ENABLE = FALSE
20	Fast Stop Active	Trip Active	Trip (includes CONTACTOR CLOSED = FALSE)
21	Fast Stop Active	Switch On Disabled	Fast Stop timer expired or FAST STOP MODE = Coast Stop OR Inverter at zero setpoint
22	Trip Active	Tripped	Stack quenched
23	Tripped	Switch On Disabled	Trip = FALSE and TRIP RESET 0->1 transition

Table 4-3 Transition Matrix

State Diagram

4-4 Sequencing Logic

External Control of the Inverter

Communications Command

When sequencing is in the Remote Comms mode, the sequencing of the Inverter is controlled by writing to the hidden parameter COMMS COMMAND (Tag 271). This parameter can only be written to using a communications interface. The output parameter (Tag 273) COMMS COMMAND of the COMMS CONTROL function block is provided as a diagnostic.

The COMMS COMMAND parameter is a 16-bit word based on standard fieldbus drive profiles. Some bits are not implemented in this release (see “Supported” column of the table below).

Bit	Name	Description	Supported	Required Value
0	Switch On	OFF1 Operational	✓	
1	(Not) Disable Voltage	OFF2 Coast Stop	✓	
2	(Not) Quick Stop	OFF3 Fast Stop	✓	
3	Enable Operation		✓	
4	Enable Ramp Output	=0 to set ramp output to zero		1
5	Enable Ramp	=0 to hold ramp		1
6	Enable Ramp Input	=0 to set ramp input to zero		1
7	Reset Fault	Reset on 0 to 1 transition	✓	
8				0
9				0
10	Remote	=1 to control remotely		1
11				0
12				0
13				0
14				0
15				0

Switch On

Replaces the RUN FWD, RUN REV and NOT STOP parameters of the SEQUENCING LOGIC function block. When Set (=1) is the same as :

$$\begin{array}{ll} \text{RUN FWD} & = \text{TRUE} \\ \text{RUN REV} & = \text{FALSE} \\ \text{NOT STOP} & = \text{FALSE} \end{array}$$

When Cleared (= 0) is the same as :

$$\begin{array}{ll} \text{RUN FWD} & = \text{FALSE} \\ \text{RUN REV} & = \text{FALSE} \\ \text{NOT STOP} & = \text{FALSE} \end{array}$$

(Not) Disable Voltage

ANDED with the NOT COAST STOP parameter of the SEQUENCING LOGIC function block. When both Set (=1) is the same as:

$$\text{NOT COAST STOP} = \text{TRUE}$$

When either or both Cleared (= 0) is the same as :

$$\text{NOT COAST STOP} = \text{FALSE}$$

(Not) Quick Stop

ANDED with the NOT FAST STOP parameter on the SEQUENCING LOGIC function block.
When both Set (=1) is the same as:

NOT FAST STOP = TRUE

When either or both Cleared (= 0) is the same as :

NOT FAST STOP = FALSE

Enable Operation

ANDED with the DRIVE ENABLE parameter on the SEQUENCING LOGIC function block.
When both Set (=1) is the same as:

DRIVE ENABLE = TRUE

When either or both Cleared (= 0) is the same as :

DRIVE ENABLE = FALSE

Enable Ramp Output, Enable Ramp, Enable Ramp Input

Not implemented. The state of these bits must be set (=1) to allow this feature to be added in the future.

Reset Fault

Replaces the REM TRIP RESET parameter on the SEQUENCING LOCIC function block.

When Set (=1) is the same as:

REM TRIP RESET = TRUE

When Cleared (= 0) is the same as :

REM TRIP RESET = FALSE

Remote

Not implemented. It is intended to allow the PLC to toggle between local and remote. The state of this must be set (=1) to allow this feature to be added in the future.

Example Commands

047F hexadecimal to RUN

047E hexadecimal to STOP

4-6 Sequencing Logic

Communications Status

The COMMS STATUS parameter (Tag 272) in the COMMS CONTROL function block monitors the sequencing of the Inverter. It is a 16-bit word based on standard fieldbus drive profiles. Some bits are not implemented in the initial release and are set to 0 (see “Supported” column of the table below).

Bit	Name	Description	Supported
0	Ready To Switch On		✓
1	Switched On	Ready for operation (refer control bit 0)	✓
2	Operation Enabled	(refer control bit 3)	✓
3	Fault	Tripped	✓
4	(Not) Voltage Disabled	OFF 2 Command pending	✓
5	(Not) Quick Stop	OFF 3 Command pending	✓
6	Switch On Disable	Switch On Inhibited	✓
7	Warning		
8	SP / PV in Range		
9	Remote	= 1 if Drive will accept Command Word	✓
10	Setpoint Reached		
11	Internal Limit Active		
12			
13			
14			
15			

Ready To Switch On

Same as the SWITCH ON ENABLE output parameter of the SEQUENCING LOGIC function block.

Switched On

Same as the SWITCHED ON output parameter of the SEQUENCING LOGIC function block.

Operation Enabled

Same as the RUNNING output parameter of the SEQUENCING LOGIC function block.

Fault

Same as the TRIPPED output parameter of the SEQUENCING LOGIC function block.

(Not) Voltage Disabled

If in Remote Comms mode, this is the same as Bit 1 of the COMMS COMMAND parameter. Otherwise it is the same as the NOT COAST STOP input parameter of the SEQUENCING LOGIC function block.

(Not) Quick Stop

If in Remote Comms mode, this is the same as Bit 2 of the COMMS COMMAND parameter. Otherwise it is the same as the NOT FAST STOP input parameter of the SEQUENCING LOGIC function block.

Switch On Disable

Set (=1) only when in START DISABLED state, refer to Table 4-1.

Remote

This bit is set (= 1) if the Inverter is in Remote mode **AND** the parameter REMOTE COMMS SEL of the COMMS CONTROL function block is Set (= 1).

APPLICATION MACROS

The Default Application

The Inverter is supplied with 8 macros, Macro 0 to Macro 7. Each macro recalls a pre-programmed set of parameters when it is loaded.

- Macro 0 will not control a motor. Loading Macro 0 removes all links, and sets all parameters to the values defined for each function block in Chapter 1 “Programming Your Application”.
- Macro 1 is the factory default macro, providing for basic speed control
- Macro 2 is a set-up providing speed control with Raise/Lower Trim
- Macro 3 is for PID process control
- Macro 4 is a Speed Programmed Winder (SPW) macro.
- Macro 5 supplies speed control using preset speeds.
- Macro 6 provides for basic speed control with similar functionality to the 620 and 590+ Series Drives.
- Macro 7 is for Phase/Register applications.

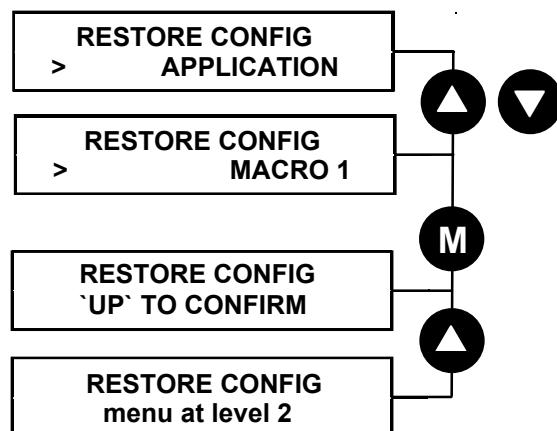

How to Load a Macro

RESTORE CONFIG

This menu restores the displayed application to the drive. The information is saved on power-down.

Also listed with your application names are the factory macros.

To restore an application see below.

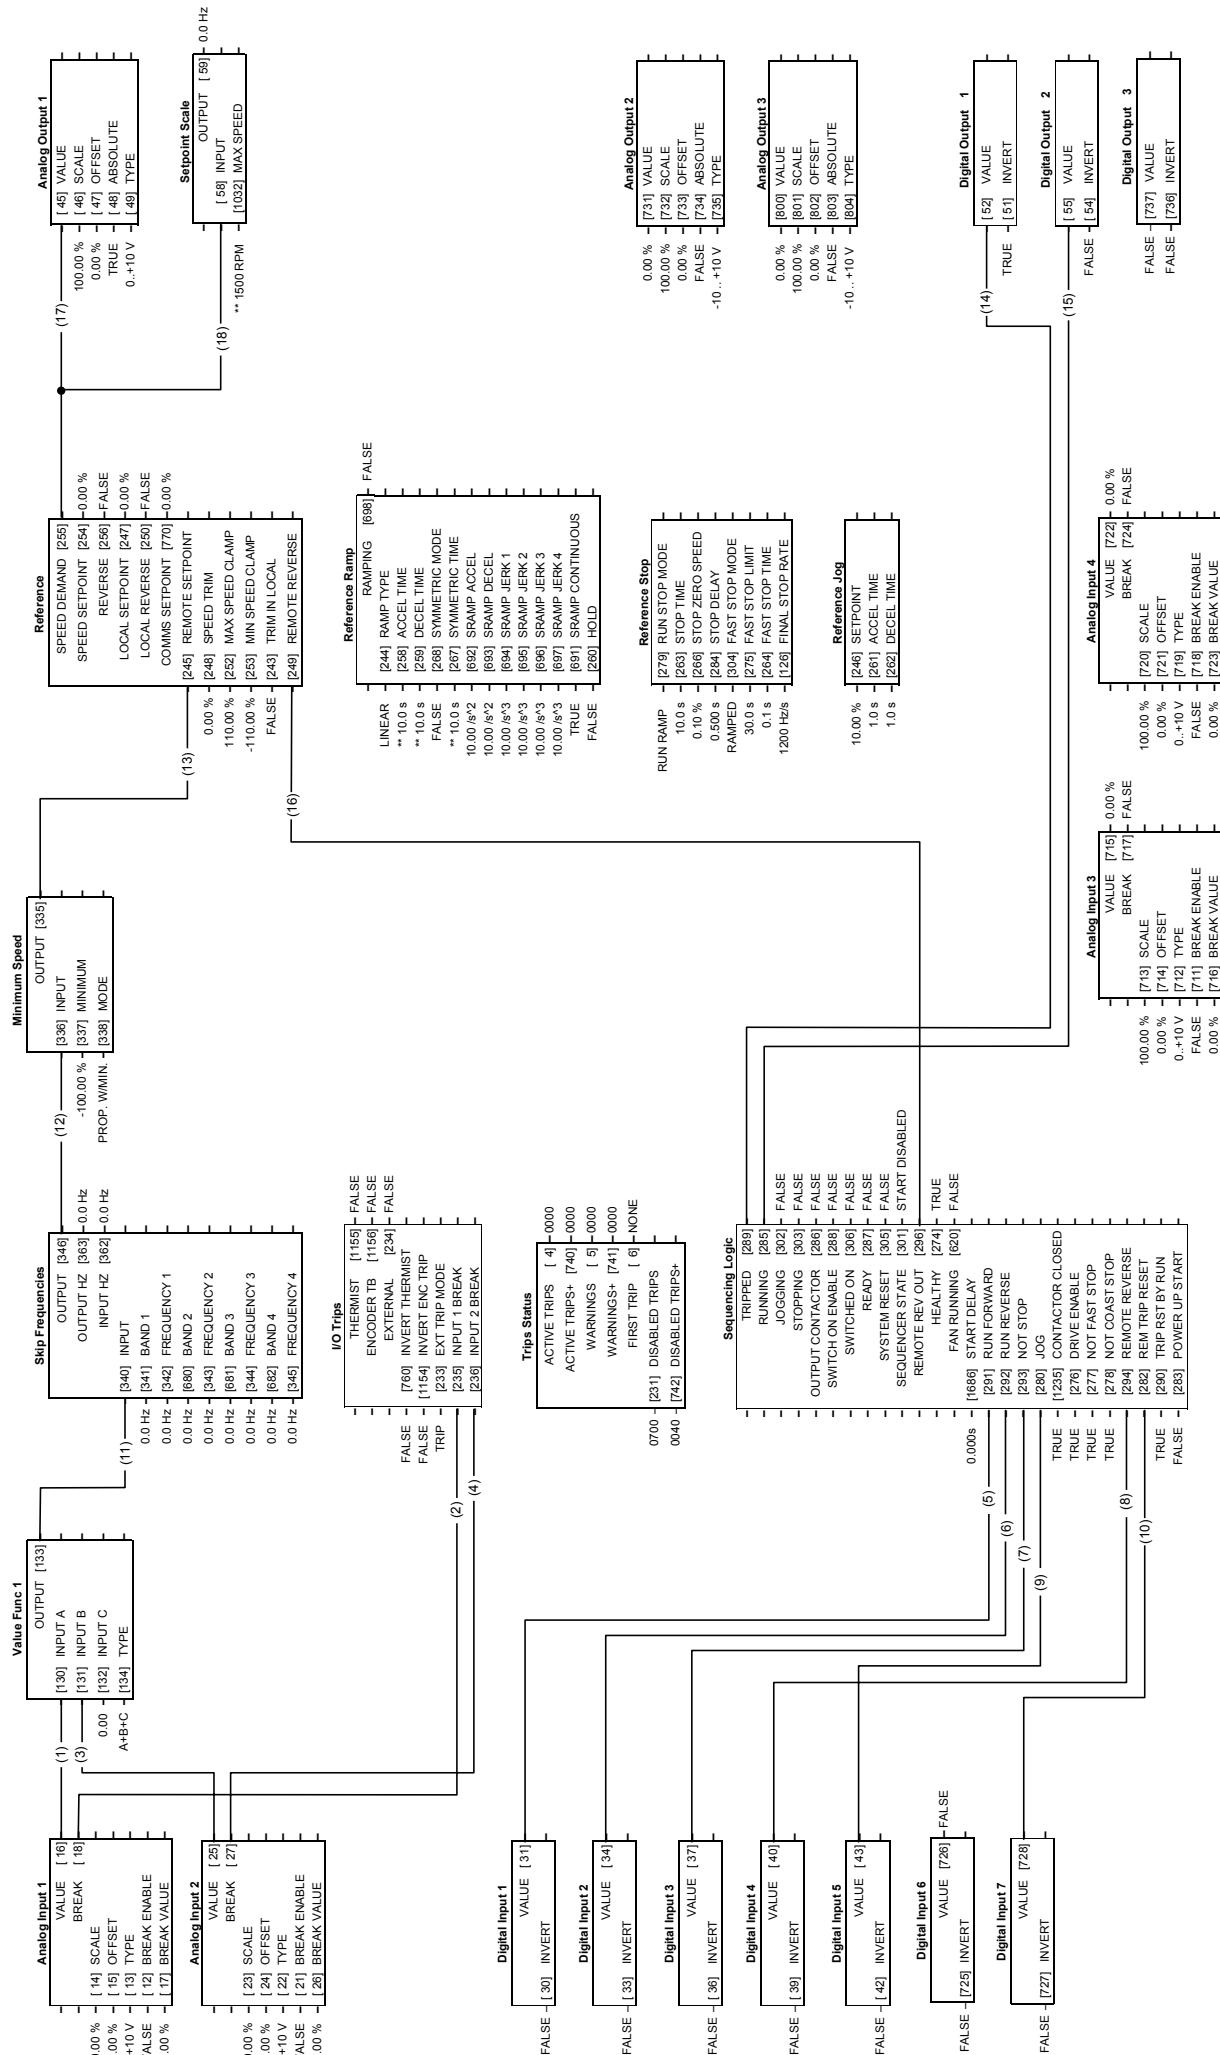

Now update the non-volatile memory within the Inverter by performing a SAVE CONFIG. Refer to the Installation Product Manual, Chapter 5: “The Operator Station” - Saving/Restoring/Deleting Your Application

Macro Descriptions

Note: Parameters whose default values are product-related are indicated in the block diagrams with * or **. Refer to Chapter 2: “Parameter Specification” - Product-Related Default Values.

5-2 Application Macros

Macro 1: Basic Speed Control (default)

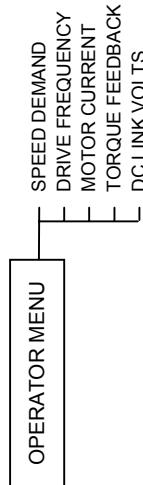

Macro 1: Basic Speed Control (default)

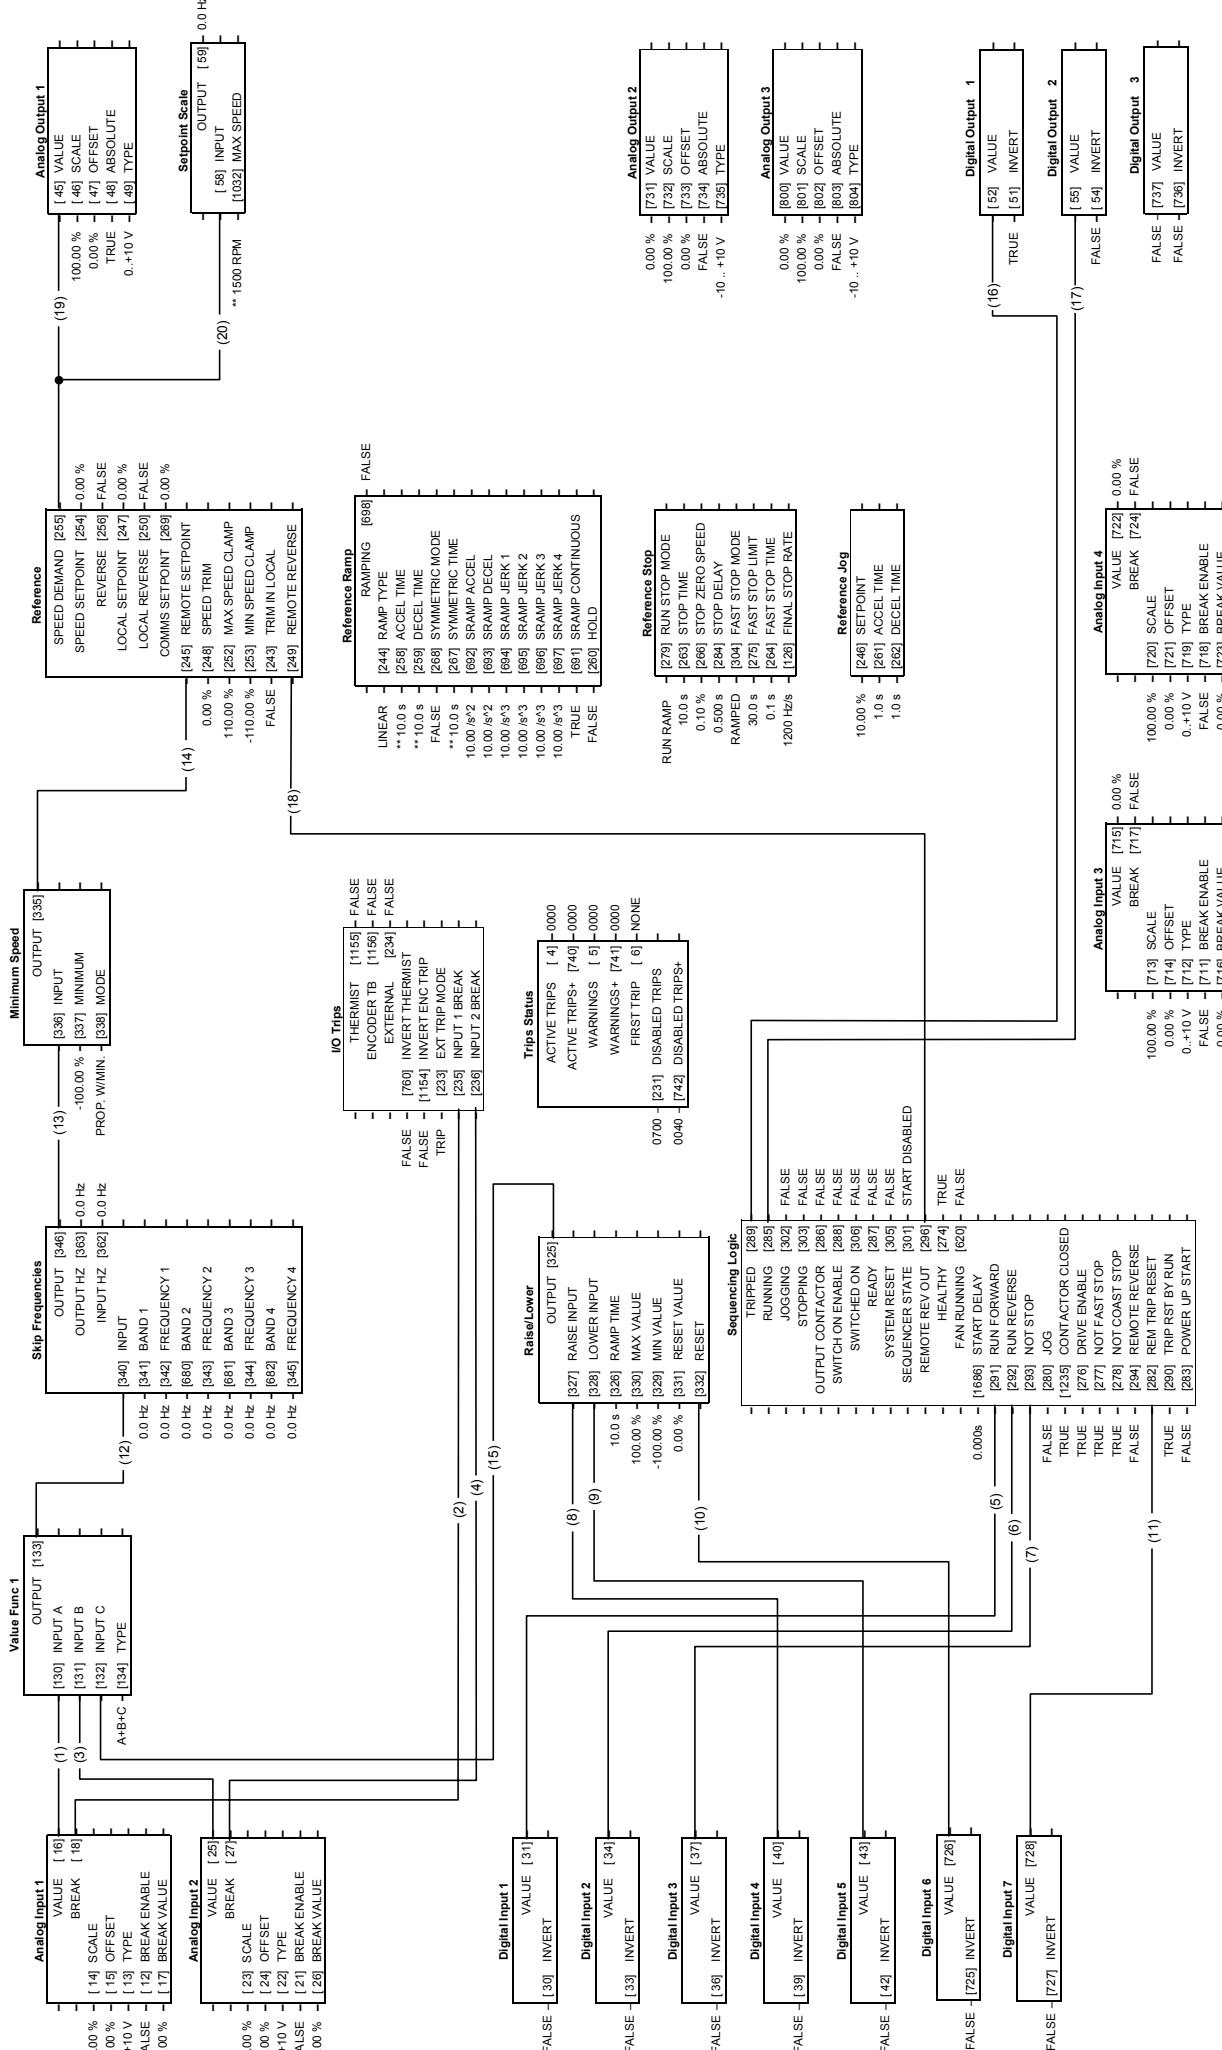

This macro provides standard control of the inverter.

Control Wiring I/O			
Terminal	Name	Purpose	Comment
2	ANALOG INPUT 1	Speed Setpoint	0V = 0%, 10V = 100%
3	ANALOG INPUT 2	Speed Trim	0V = 0%, 10V = 100%
6	ANALOG OUTPUT 1	Ramp Output	absolute speed demand 0V = 0%, 10V = 100%
12	DIGITAL INPUT 1	Run Forward	24V = run forward
13	DIGITAL INPUT 2	Run Reverse	24V = run reverse
14	DIGITAL INPUT 3	Not Stop	24V = RUN FWD and RUN REV signals latched 0V = RUN FWD and RUN REV signals not latched
15	DIGITAL INPUT 4	Remote Reverse	0V = remote forward 24V = remote reverse
16	DIGITAL INPUT 5	Jog	24V = jog
18	DIGITAL INPUT 7	Remote Trip Reset	24V = reset trips
19	DIGITAL INPUT 8	External Trip	<i>Non-configurable</i> 0V = Trip (connect to terminal 20)
21, 22	DIGITAL OUTPUT 1	Health	0V = tripped, i.e. not healthy
23, 24	DIGITAL OUTPUT 2	Running	0V = stopped, 24V = running

The Operator Menu for Macro 1

The default Operator Menu is shown below.

Macro 2: Raise/Lower Trim

This macro provides a raise/lower (push button) interface for an additional Setpoint Trim. The Setpoint is derived from the sum of the ANALOG INPUT 1, ANALOG INPUT 2 and the output of the raise/lower ramp. This ramp is controlled by the 3 digital inputs RAISE INPUT, RAISE LOWER and RESET of the RAISE/LOWER function block.

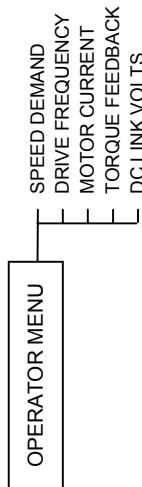

The raise/lower trim is restricted to be +/- 10.00%. This limit is set by the MIN VALUE and MAX VALUE parameters in the RAISE/LOWER function block.

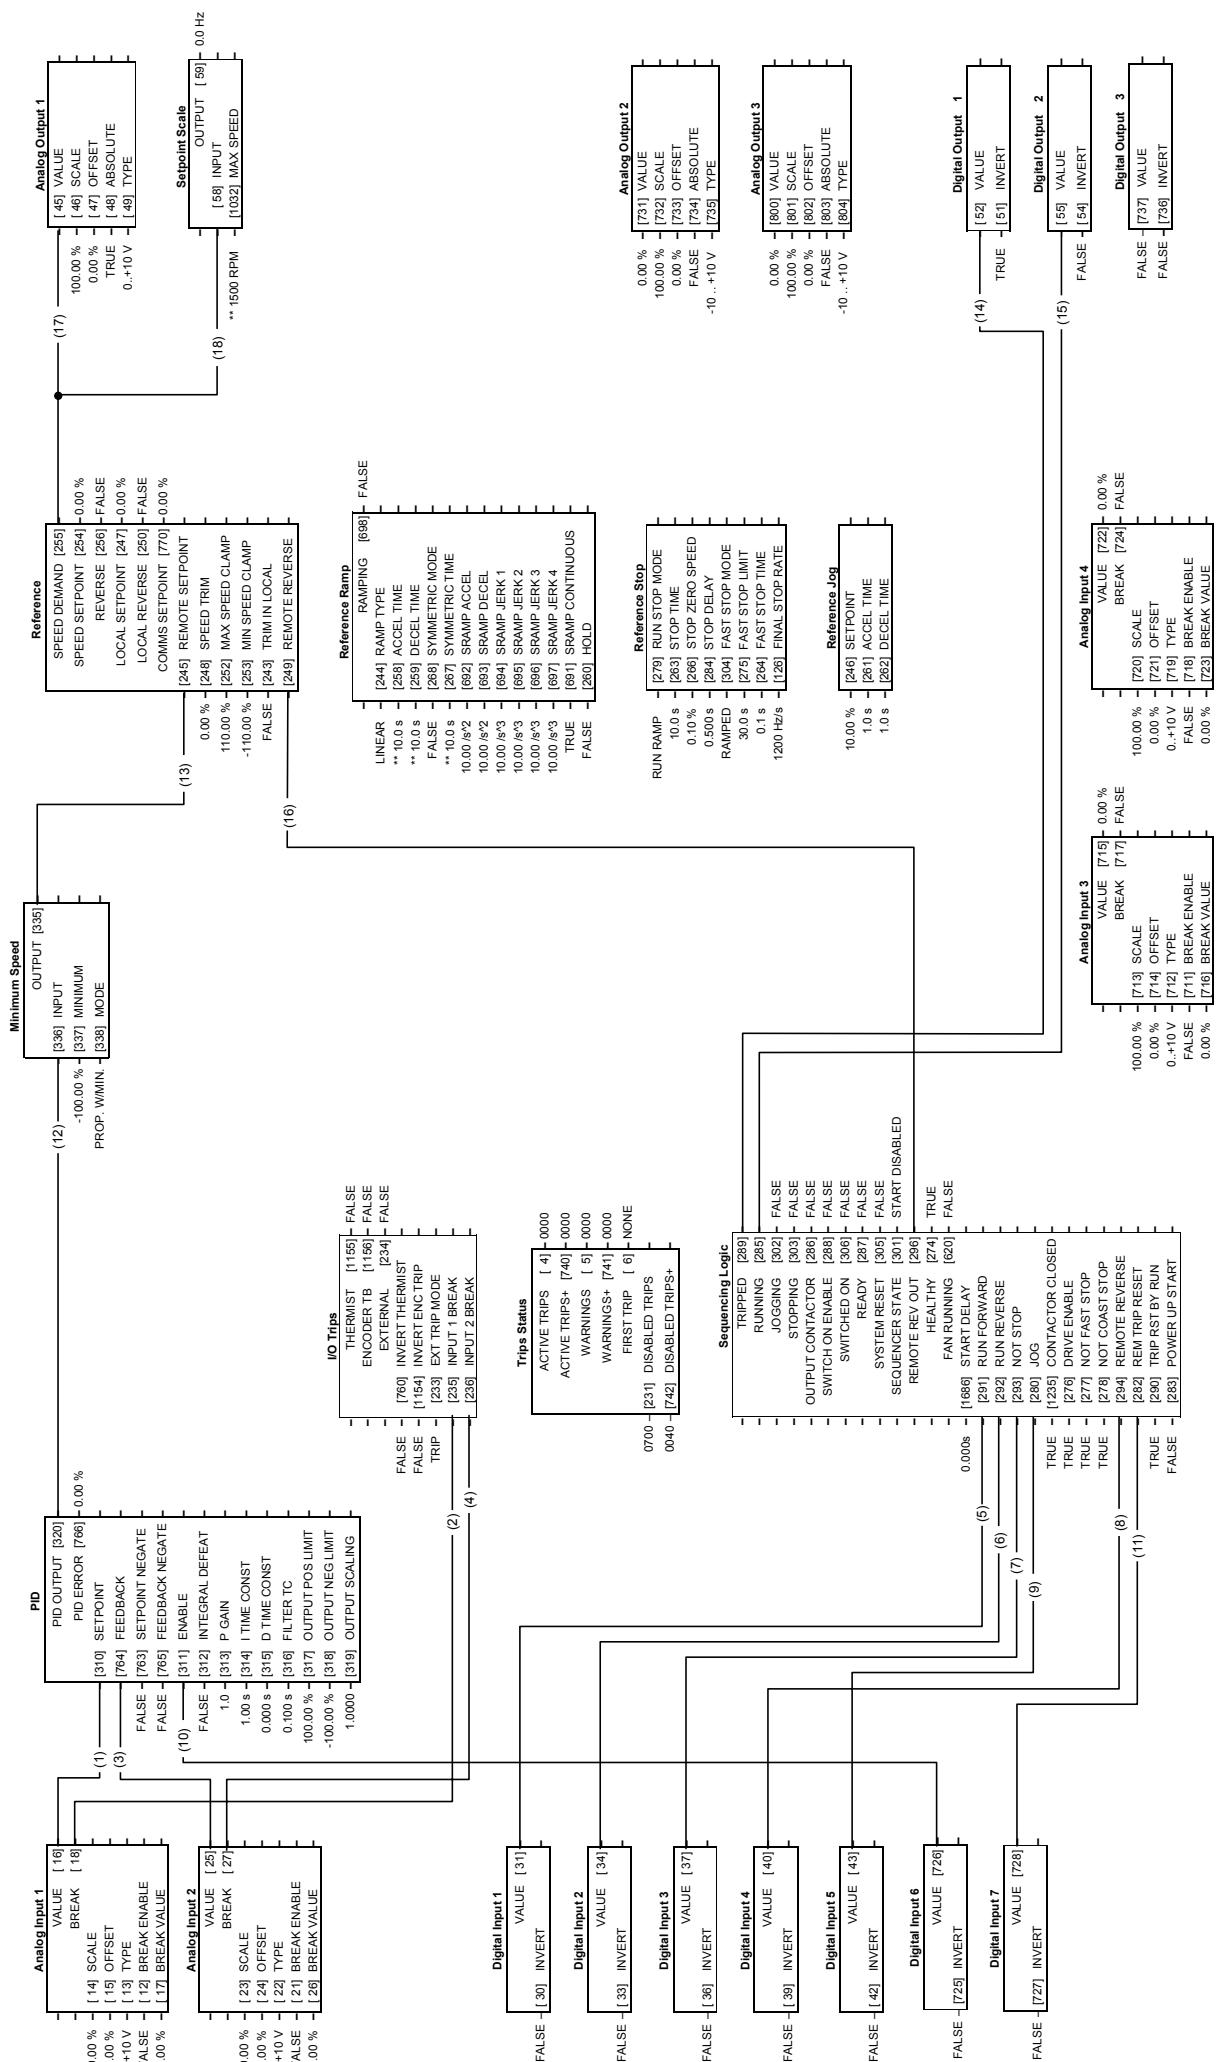

Note that the raise/lower ramp output is automatically preserved in non-volatile memory during a power-down.

Control Wiring I/O			
Terminal	Name	Purpose	Comment
2	ANALOG INPUT 1	Speed Setpoint	0V = 0%, 10V = 100%
3	ANALOG INPUT 2	Speed Trim	0V = 0%, 10V = 100%

23, 24	DIGITAL OUTPUT 2	Running	0V = stopped, 24V = running

The Operator Menu for Macro 3

The default Operator Menu is shown below.

Macro 4: Speed Programmed Winder (SPW)

Macro 4: Speed Programmed Winder (SPW)

The winder macro is for tension control of closed loop winders. The function blocks control the motor speed with a closed loop trim to provide constant tension throughout the roll.

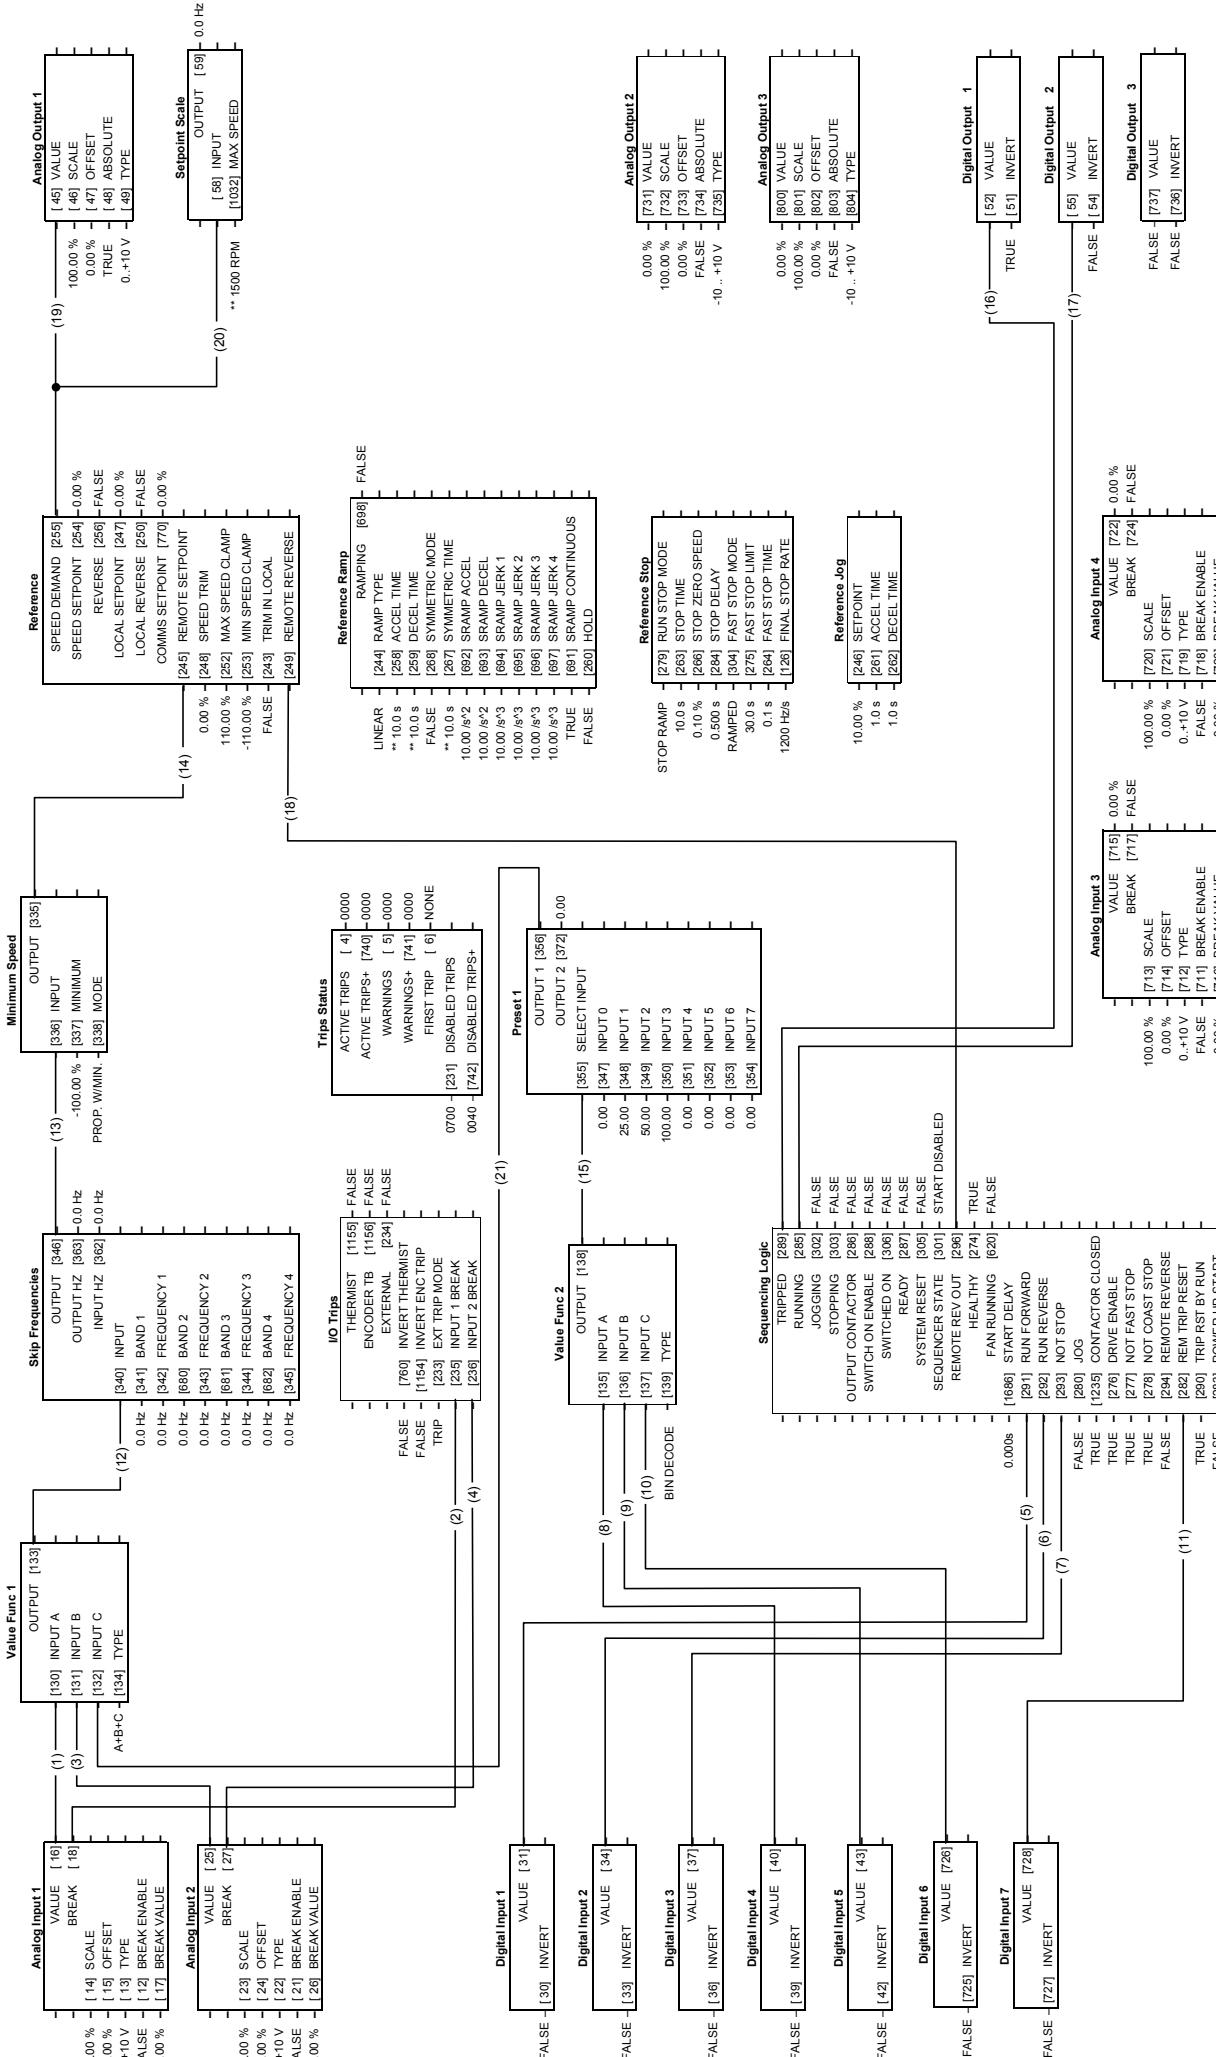

The basic tension control controls the motor speed, compensated for diameter, trimmed by a dancer position loop or a loadcell tension loop, to produce constant web tension.

Other features provide Taper Tension, Stall Tension, Tension Boost, and Inertia Compensation.

Additional Operator Menu display parameters.

System Board

Macro 7: Phase/Register

AUDIN - 7 bis rue de Tinqueux - France - Tel : 03.26.04.20.21 - Fax : 03.26.04.28.20 - Web : <http://www.audin.fr> - Email : info@audin.fr
 This macro is to be used in a slave drive set up for phase/register control. The slave will get the line speed setpoint from the master drive via the system port (serial port using the 5703 setpoint repeater). This provides the highest accuracy and least lag. If this is not possible, the speed demand should be derived from the master encoder using the Encoder Speed function block, or over the network.

Note: Register control is enabled by setting REGISTER::RESET = FALSE

If Auto-gearing is enabled, then it is important that

PHASE CONFIGURE::SCALE A = PHASE CONFIGURE::SCALE B

System Board Terminals (option)

		Terminal No.		Name	Range	Description

Macro 8: 4-Q Regen

Macro 8: 4-Q Regen

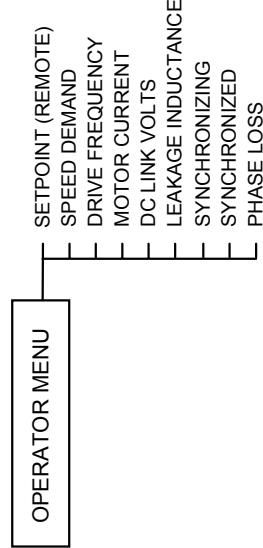

AUDIN - 7 bis rue de Tinqueux - 51100 Reims - France - Tel : 03.26.04.20.21 - Fax : 03.26.04.28.20 - Web : <http://www.audin.fr> - Email : info@audin.fr

This macro is used for common DC Link schemes. The 4-Q Regen Drive acts as a DC power supply for the common DC Link, capable of drawing and supplying sinusoidal, unity power factor current to the system 3-phase supply. Detailed description of the 4-Q Regen control mode can be found in the Application Note - refer to Chapter 7.

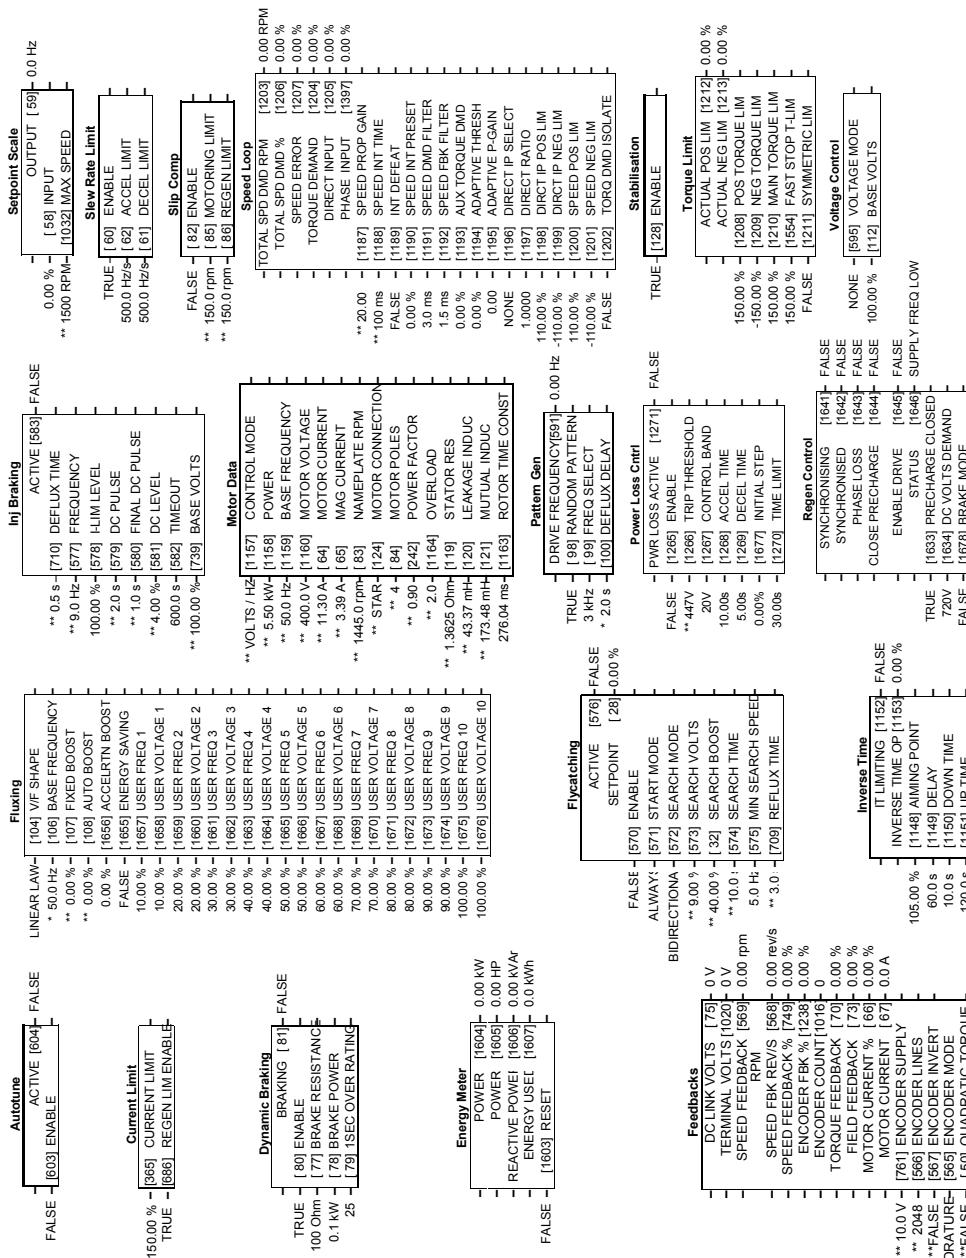

Control Wiring I/O			
Terminal	Name	Purpose	Comment
12	DIGITAL INPUT 1	Pre-Charge Closed	24V = External Contactor Closed
13	DIGITAL INPUT 2	Not Coast Stop	0V = Coast Stop
18	DIGITAL INPUT 7	Remote Trip Reset	24V = Reset Trips
19	DIGITAL INPUT 8	External Trip	Non-configurable 0V = Trip (connect to terminal 20)
21, 22	DIGITAL OUTPUT 1	Health	0V = Tripped, i.e. not healthy
23, 24	DIGITAL OUTPUT 2	Running	0V = Stopped, 24V = Running
25, 26	DIGITAL OUTPUT 3	Close Pre-Charge	0V = Pre-Charge Open 24V = Pre-Charge Closed
