

Ultrasonic Sensors

Detection Irrespective of Material, Colour and Illumination

SICK
Sensor Intelligence.

Straightforward and with many benefits: Detection by ultrasonic.

Light and sound are two natural phenomena which let every living being recognise their environment without physical contact and over widely varying distances. Likewise, industrial processes require reliable information.

Detection and measurement, regardless of material

Transparent objects such as glass and film are often a difficult task for sensors, as are clear and coloured fluids. But it is hard to deceive ultrasonic. Almost all materials affect and reflect sound waves.

Never confused by loud colours

Not even the oddest colours can bias ultrasonic sensors. Reflecting objects do not irritate them at all. When objects change colour, there is no need to readjust the sensors. They just go on working as before – can anyone think of a more convenient way?

SICK's ultrasonic sensors detect objects and measure distances with high accuracy. The realm of sound is a world of its own, and for this reason ultrasonic sensors are simply the better choice in many industrial applications requiring sensor technology.

**Highly available,
even under difficult conditions**

Dust and dirt, steam and spray are no problem for ultrasonic sensors. Unfavourable environments have little effect on them. Interferences are simply "blanked out". And they do not even mind strong light and adverse temperatures.

**Sound has an advantage -
even on superficial inspection**

Whether the surface is rough or smooth, reflecting or retroreflecting, regular or irregular in shape, ultrasonic sensors are generally unaffected. They detect objects reliably and almost independently of their appearance.

Ultrasonic proximity sensors UM30, UM18 and UC12 – powerful devices for almost any application.

Even when it's extremely dusty: The ultrasonic proximity sensors are not impaired by foreign bodies in the air, mist, vapour and dirt. Even the background suppression is near perfect. We call this concentrating on the essentials.

UM 30

Far and near – different scanning ranges

Short, medium or long-distance? The UM30 has three different scanning ranges. The minimum operating distance begins at a minute 30 mm, and for really long-distance applications, to the limit of the scanning range is astonishing 6000 mm.

Detection or measurement as required

The UM30 can be fitted with a binary output or analogue interface. Depending on the task on hand, objects can simply be detected or their distance measured.

UM 18

Smaller diameter with the same functionality

The UM18 has 1 or 2 switching outputs and extended features (for instance, ObSB mode): The sensor is taught a fixed background and reliably switches when an object is detected between sensor and background: Perfect for detecting round or tilted surfaces!

Typical applications

- Level control of solids and liquids
- Checking presence of outer packaging
- Assignment control during packaging
- Checking presence of PET bottles
- Diameter control
- Loop control

Typical applications

- Positioning of small objects in tight environments
- Checking for the presence of small, transparent or opaque outer packaging

UC12

After 2 seconds/shortest time to operation

Position object, press Teach-in button, ready. There is no faster way to commission an ultrasonic sensor. This flexibility is further enhanced by the ObSB and window modes.

- Typical applications**
- Checking presence of very dark objects
 - Level control in the food and drinks industry
 - Detecting transparent packaging
 - Detecting printed/coloured paper during the printing process

Ultrasonic proximity sensors point by point

Easy to learn – Teach-in

Setting a sensor’s parameters can sometimes be time consuming – unless you just show it what to do. We call that “Teach-in”. This makes the UM30 quick and easy to handle. And when changes have to be made, it can be re-taught in a jiffy to cope with the new situation.

Well balanced and reliable – temperature compensation

Ultrasonic time measurements depend on the state of the medium transmitting the sound, i.e. the air. UM30 sensors balance temperature fluctuations out automatically, thereby ensuring precision and reliability.

Current or voltage – the appropriate signal automatically

The analogue output of the UM30 sensor switches automatically between current and voltage. With its 4 to 20 mA or 0 to 10 V DC, it fits perfectly into any measuring environment.

Q or \bar{Q} , no problem here

What signal does the application require, Q or \bar{Q} ? The UM30 has an invertible switching output and can cope with both.

ObSB mode – Object between sensor and background

Perfect for detecting round and tilted surfaces, UM18 and UC12.

Mode of operation: detecting, measuring and switching with ultrasonic proximity sensors.

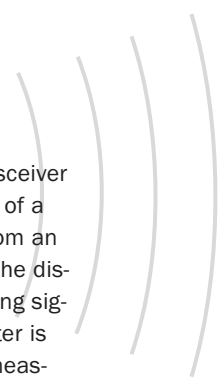

The detection of objects with ultrasonic sensors opens up a new dimension. Objects are positioned, detected and controlled virtually irrespective of material and environment.

Sensors with a profile – defining the detection area

SICK Ultrasonic Sensors generate an ultrasonic wave by means of a piezo element in the front part of the housing. The wave spreads in the atmosphere in accordance with the laws of physics. The same piezo element can detect and measure the sound reflected by an object. Therefore it functions alternately as sender and receiver (transceiver).

The measurement principle of ultrasonic sensors is based on the time taken for ultrasonic to travel through the medium air. The signals are transmitted in defined “packages”.

With the help of its processing electronics, the transceiver evaluates the time taken between the transmission of a sound “package” and the arrival of the reflection from an object. As a result, either a signal proportionate to the distance is sent via an analogue interface, or a switching signal depending on a previously set distance parameter is sent through a binary output. The accuracy of the measurement and the maximum scanning range lie within a tolerance range which depends mainly on the state of the carrier medium air and the roughness of the object in question.

Positioning

Detection

Recognise transparent objects

Unwind

Distance measurement for diameter check

Sensors in action – scanning and measuring reflections

Ultrasonic sensors UM30 are used as non-contact proximity switches which process reflected signals, e.g. from objects on a conveyor belt. An essential benefit of the working principle of ultrasonic sensors is the almost complete blanking of the background, a prerequisite for accurate detection.

Scanning round corners – thanks to the right accessories

Ultrasonic sensors UM30 are small and easily installed even in confined spaces. And if things get really tight, the right accessories can help out. Suitable reflectors allow sound to be deflected almost without loss.

Package

“Engaged” check on package content

Adjust

Control material looping

Monitoring

Level control in silos and containers

Ultrasonic double-sheet control UM18, the specialist for double layers – with smart vision.

UM18 FOR DOUBLE-SHEET CONTROL

When ultrasonic is used to detect two thin sheets, one of which is immediately behind the other, e.g. paper, film or thin sheet material, separate sender and receiver units are required. The continuously transmitted sonic waves packages cause vibrations in the first sheet which it then transmits via the intervening air to the second sheet, which also begins to vibrate. The receiver unit is able to detect these weakened signals via the air.

The sender and receiver units of the UM18 are only 40 mm apart and work effectively without having to be parametered. They adjust automatically to a wide spectrum of different materials.

UM18 sheet for sheet

- Double-sheet check for film, paper, corrugated cardboard and fine metal sheet
- Automatic adjustment
Alignment and Teach-in unnecessary
- Compact design
- Plug and Play
- 2 PNP outputs for double- and mis-fed-sheets

A sensor that does not stop at the surface

Detection of two superimposed sheets of material is no easy matter.

The UM18 can find out whether one or two sheets of film, paper, metal or cardboard lie between its sender and receiver. Which other sensor is able to look beyond the surface?

No need to tell it what to do

The UM18 adjusts to its task itself. Fully automatically. Film down to 0.4 mm in thickness, paper of 1200 g/m² or metal sheet of 0.3 mm thickness – almost anything is detected.

Small and versatile

The sender and receiver of the UM18 are located in an 18 mm threaded tube, and, because they are mounted only 40 mm apart, can be accommodated in the most confined spaces.

With regard to alignment to the sheets, the UM18 is undemanding. It puts up with as much as 45 degrees deviation from the vertical.

Detection range and assembly of ultrasonic sensors.

Detection range

To determine the area of detection of the sensors, a series of measurements are carried out with two standardised objects, a thin round rod and a plate. The three-dimensional area within which the sensor responds to the rod has the form of a thin club. It marks the typical operating scanning range of the sensor.

The sensor responds to the plate within the area of a larger beam. This area defines the maximum or limit detection range of the sensor.

When projected onto a two-dimensional grid, typical profiles are created. These are the operating diagrams of the ultrasonic sensors, from which the operating scanning range, the limiting scanning range, the specific shape and the blind zone of the detection range can be read off. Objects which are smaller than the round rod may only be detected within an area smaller than the operating scanning range.

Every ultrasonic sensor has its characteristic club-shaped detection range. It is narrow for smaller objects and wide for larger ones. The typical detection areas are depicted by sound-beam diagrams.

Installation

Ultrasonic sensors installed close together or opposite one another may affect each other mutually. For this reason, different axial and lateral distances have to be maintained depending on the detection range. The sensor with the largest detection range determines the minimum distance.

Operating scanning range	Min. installation distance A	Min. installation distance B
0.25 m	10 cm	> 100 cm
0.35 m	> 30 cm	> 170 cm
1.3 m	> 60 cm	> 540 cm
3.4 m	> 160 cm	> 1600 cm
6 m	> 260 cm	> 3000 cm

Operating scanning range
30 ... 1300 mm

Ultrasonic sensor

- Independent of material shape (including films, glass and bottles)
- Teach-in
- Insensitive to dirt, dust and fog
- Operating scanning range up to 1300 mm
- Binary outputs or analogue output

 $I_{max} = 200 \text{ mA}$
 PNP: High = $V_s - (< 2 \text{ V})$ / LOW = 0 V
 NPN: High = V_s / LOW ≤ 2 V

²⁾ Temperature compensation at -20 ... +65 °C

³⁾ Ultrasonic transducer: Polyurethane-foam, glass epoxy resin

Measurement ranges

- 1 Aligned plate 10 x 10 mm²
- 2 Pipe diameter 10 mm
- 3 Operating scanning distance
- 4 Limiting scanning distance

UM18 Ultrasonic double-sheet detector

 **Operational area**
40 mm ± 3 mm

Ultrasonic double-sheet detector

- Double-sheet detection of foils, metal sheets and ultra-fine corrugated cardboards
- Automatic adjustment, no Teach-in necessary
- Colour-independent
- Plug & Play
- 2 PNP outputs for double- and mis-fed-sheets

Dimensional drawing

Adjustments possible

UM18-20012

- 1 Connection cable 2 m (receiver)
- 2 Connection cable 1.2 m, 2-pin sender and receiver
- 3 2-color LED indicator, receiver
- 4 Connection cable 1 m, 2-pin sender and receiver
- 5 Fastening nuts, width across 24 mm

Connection types

UM18-20012*)

Receiver

Sender

5 x 0.25 mm²

2-pin

2-pin

*) Sender/receiver pair:
Individual components on request

Accessories
Mounting systems

Technical data	UM18-	20012											
----------------	-------	-------	--	--	--	--	--	--	--	--	--	--	--

Installation distance

sender – receiver	40 mm ± 3 mm	
Blind zone	7 mm, each time before sender and receiver	
Permissible angle deviation	± 45° perpendicular to sheet	
Ultrasonic frequency	400 kHz	
Resolution	Double-sheets not completely glued together	

Operational area

Paper grams per square meter	20 ... 1200 g/m ²	
Metal-laminated sheets and films	≤ 0.4 mm thickness	
Self-adhesive films, metal sheets	≤ 0.3 mm	
Ultra-fine corrugated cardboard		

Supply voltage V_s	20 ... 30 V DC ¹⁾	
Ripple	± 10 %	

Current consumption ²⁾	≤ 45 mA	
-----------------------------------	---------	--

Double-sheet switching/Q₁ ³⁾	Q ₁ : PNP, V _s -2 V, I _{max} = 500 mA	
---	--	--

Mis-fed-sheet switching/output/Q₂ ³⁾	Q ₂ : PNP, V _s -2 V, I _{max} = 500 mA	
---	--	--

Response time ⁴⁾	2.5 ms or 6.5 ms	
-----------------------------	------------------	--

Off delay	10 ms	
-----------	-------	--

V _s at control unit ⁴⁾	Response time 6.5 ms: V _s > 9 V DC Response time 2.5 ms: V _s < 5 V DC	
--	--	--

Standby delay	300 ms	
---------------	--------	--

Connection type	Cable PVC, 2 m; 5 x 0.25 mm ²	
------------------------	--	--

Sender cable ⁵⁾	PVC, 1.2 m with 2-pin plug	
----------------------------	----------------------------	--

Receiver cable ⁵⁾	PVC, 1 m with 2-pin plug	
------------------------------	--------------------------	--

Enclosure rating	IP 65	
-------------------------	-------	--

Ambient temperature	Operation +5 °C ... +60 °C Storage -40 °C ... +85 °C	
----------------------------	---	--

Weight	280 g	
---------------	-------	--

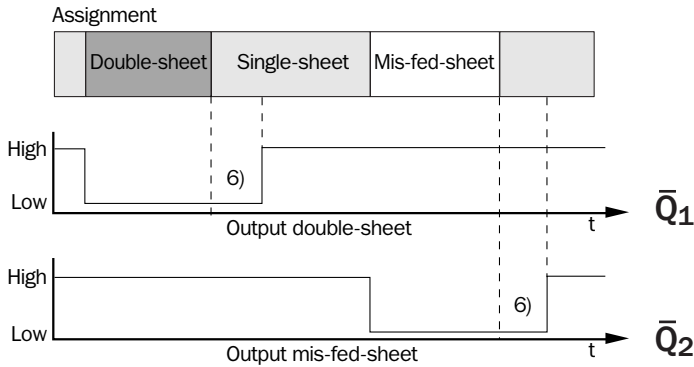

Housing material	Nickel-plated brass	
-------------------------	---------------------	--

- ¹⁾ Limit values
- ²⁾ Without load
- ³⁾ Outputs short-circuit protected, Opener; no switching hysteresis
- ⁴⁾ If the control line is laid against a ground, the response time is 2.5 ms. If the control line is laid against L+, the response time is 6.5 ms.
- ⁵⁾ Not reverse-polarity protected
